I did some testing on the batteries I got and found a number of weak cells that did not show up until I tested with a load. The battery packs are made up of six 2 volt cells with copper straps between them. The cells are held together with molded plastic bottom and top pieces that make a single unit. I am trying to make up 3 good packs. I hope to get a few more battery packs in the near future and to swap out all weak cells so I can give you the strongest battery packs possible. One pack is currently on a desulfater which has already made some improvement. I might not have them ready by the meeting but I am working toward getting you 3 packs as requested.

John

5019. Roll your car windows down first . . . .Here's Why

Yahoo group: Temple_ARC

From: paul molina
Topic: 5019 Message: 5019

Subject: Roll your car windows down first . . . .Here's Why

The other day I heard my car mechanic explaining to a lady to roll her windows down and let the hot air escape before running her A/C which has to cool the air in her car and recirculate it. If it is super heated it takes much longer to get the temperature comfortable than it does if it is at least brought down to the outside temp.

My car book says to roll down the windows to let out all the hot air before turning on A/C.

WHY ?

Car Air-conditioning -

No wonder more folks are dying from cancer than ever before. We wonder where this stuff comes from but here is an example that explains a lot of the cancer causing incidents.

Many people are in their cars first thing in the morning and the last thing at night, 7 days a week.

As I read this, it makes me feel guilty and ill. Please pass this on to as many people as possible. Guess its not too late to make some changes.

Car A/C (Air Conditioning) MUST READ!!!

Please do NOT turn on A/C as soon as you enter the car.

Open the windows after you enter your car and then turn ON the AC after a couple of minutes.

Here's why: According to research, the car dashboard, seats, air freshener emit Benzene, a Cancer causing toxin (carcinogen - take time to observe the smell of heated plastic in your car).

In addition to causing cancer, Benzene poisons your bones, causes anemia and reduces white blood cells. Prolonged exposure will cause Leukemia, increasing the risk of cancer. Can also cause miscarriage.

Acceptable Benzene level indoors is 50 mg per sq.ft. A car parked indoors with windows closed will contain 400-800 mg of Benzene.

If parked outdoors under the sun at a temperature above 60 degrees F, the Benzene level goes up to 2000-4000 mg, 40 times the acceptable level.

People who get into the car, keeping windows closed will inevitably inhale, in quick succession, excessive amounts of the toxin.

Benzene is a toxin that affects your kidney and liver.. What's worse, it is extremely difficult for your body to expel this toxic stuff.

So friends, please open the windows and door of your car - give time for interior to air out -dispel the deadly stuff - before you enter.

This is what http://www.snopes.com/; http://www.snopes.com/medical/toxins/benzene.aspsays. It is not the air conditioning in the car but the Benzene producing agents that cause cancer.

5022. Winlink2000

Yahoo group: Temple_ARC
Date: 2010-08-06 23:52:57 UTC
From: joebdorn
Topic: 5022 Message: 5022

I brought up Winlink2000 at the TARC meeting last night and decided to post sources of information on the system.

For those of you who were not at the TARC meeting last night, WinLink2000 is an AMATEUR RADIO RESOURCE,i.e: you must be a licensed ham to become a user; the software is excellent and the cost is right, FREE.

WL2K is a system that allows radio access to the internet for email and transfer of the more common attachments (Excel, MSWord, PDF's etc.): It does not support browsing. The system was developed to allow blue water sailors and RV's to gain access to their email via HF and Pactor modems. The system was then enhanced to use VHF via packet TNCS and sound cards.

The ARRL gave it's blessing to WL2K in 2004 and I immediately saw it as an excellent tool to replace or supplement the long-in-tooth National Traffic System and included the capabilities in the Central Texas Trauma Council Radio Network (now 16 hospitals in Bell and 6 other adjacent counties).

I now refer to the network as 'The Central Texas Amateur Radio Network' since it includes other emergency responder locations such as the Bell and Milam County EOC's.

For more information on the system go to:

http://www.winlink.org/

On that site is a pointer to 'WL2K for the "Digitally Challenged"', an excellent step by step guide for installing and making a node operational. You can get there via:

http://www.winlink.org/GetStarted

The support is excellent for helping you get through the start-up overload of acronyms, terms and programs. I will probably go through it again if sufficient interest is shown so that I can get back up to speed since WL2K is an evolving system.

The packet backbone is in place on 145.070 and I have an active RF interface into the system via W5VEX-10, west of Belton.

If enough interest is shown, I will invite Tom Whiteside, the ARRL South Texas Emergency Manager and WL2K expert to give a presentation at a joint session of TARC and CTARC.

In order to evaluate the interest, I am setting up an email distribution list for WL2K. If you wish to be included on the list please send me a request at:

5023. FCC Rulemaking on Emergency Comm published in Federal Register

Yahoo group: Temple_ARC
Date: 2010-08-09 22:37:33 UTC
From: n5gar
Topic: 5023 Message: 5023

FCC Rulemaking on Emergency Comm published in Federal Register

This proceeding started with a petition for rulemaking I submitted to the FCC. Three amateurs organized the Amateur Radio Policy Committee to resolve an urgent issue with Emergency Communications, and a message from FCC Attorney Laura Smith. We requested changes to Part 97.113. I took steps to see that the FCC acted quickly. In the end, the FCC said "We appreciate both of these filings, and, as discussed herein, support the requested rule changes." (paragraph 21)

There's more information and Internet links here:

http://www.qrz.com/db/N5GAR

As things stand now, it's easier to transact business with the FCC than with the ARRL.

Subject: Re:aprs and packlink

I am trying to configure APRS and Packlink.

I appear to be transmiting on both.

I find nothing on FINDU as far as a listing.

I therefore suppose there is something wrong with my settings.

I am in Waco. I hear APRS data being transmitted and it posts to my winlink map.

I do not think I am close enough to anyone that I will be able to do use Packlink but I am trying to set it up just for the sake of the knowledge.

Is there someone here locally that could help me.

5028. Will you?

Yahoo group: Temple_ARC
Date: 2010-09-20 23:48:14 UTC
From: myronmesecke
Topic: 5028 Message: 5028

The October QST column It Seems To Us is written by ARRL President Kay Craigie N3KN. She has titled it, Say Yes. I wish to quote one small portion of the column.
"That's what leaders in our Amateur Radio family have in common. No matter how we differ in our educational or occupational backgrounds, whatever the demographic details of our personal lives, regardless of our license class or favorite things to do in Amateur Radio, we are the first ones to say "yes."
"I don't care if you are so new you have to sneak a peek at your license to remember your callsign, or have been licensed so long you can copy code in ancient Egyptian hieroglyphics. You can be a leader in Amateur Radio. It all begins with saying "yes."
I hope everyone in TARC considers saying "Yes."

5029. Call for VE's this Saturday...

Yahoo group: Temple_ARC
Date: 2010-09-29 18:46:17 UTC
From: Joe Dorn, W5VEX
Topic: 5029 Message: 5029

One of the big VE test sessions will be this Saturday at the Belton police station in conjunction with the Ham Expo. We need all of the VE's available to support the expected candidates.

We will especially need the experienced VE's since I may not be available (possible weekend at the Scott and White Health Spa). Gerald Richmond and James Cleveland will be in charge of the tests and paperwork and need your support.

Please be at the police station by 10:30 so that we can get you in position.

Thanks.

From: Joe Dorn, W5VEX
Topic: 5030 Message: 5030
Attachments: 3 described; binary payloads are missing from this source WARC

[Joe Dorn, W5VEX] also copied to my email lists.

I would like to add my endorsement to Dr. David Woolweaver and his choice for the Vice director, John Robert Stratton.

Many of you know that I have followed the ARRL politics over the years, and in my opinion Dr. Woolweaver has more than walked the talk, especially in amateur radio evolvement in emergency communications. He, along with the outstanding leadership of the South Texas Section, has made amateur radio a vital resource during hurricane activities; this also makes the area ready to respond to other events, natural and manmade. (Dr. Woolweaver lives in the Rio Grande Valley, one of the most frequent targets of the Gulf storms.)

I know very little about the other candidates and I expect they are good people with amateur radio foremost in their minds; I do know Dr. Woolweaver and his history and feel that the bird in hand is worth two in the bush.

I have not yet received my ballot but as soon as I do, it will be returned with the check next to the incumbents.

Vote West Gulf
Division

From:

David Woolweaver
K5RAV

woolweaversm 8
Director

John Robert Stratton
N5AUS
strattonsm 2
Vice Director

We are K5RAV and N5AUS - your current West Gulf Division Director and Vice Director - and we are running for reelection.

We have been endorsed by all of the current and past West Gulf leadership, including:

The 3 Texas Section Managers

NTX, Jay Urish (W5GM)
STX, Lee Cooper (W5LHC)
WTX, John Dyer (AE5B)

The Oklahoma Section Manager-Elect

Kevin O'Dell (N0IRW)

The Former West Gulf Director

Coy Day (N5OK)

ARRL President Emeritus

Jim Haynie (W5JBP)

We are asking for your vote, not just on the strength of our endorsements, but on a record and a detailed, realistic plan for the future of Amateur Radio and the West Gulf that we respectfully believe warrants reelection.

To see who we are, our record of service to the ARRL and that detailed, realistic plan, please go to our website:

<http://www.VoteWestGulf.org> www.VoteWestGulf.org

If you still have questions after visiting <http://www.VoteWestGulf.org> www.VoteWestGulf.org, please call K5RAV at 1-956-793-2500 or N5AUS at 1-512-426-2028. Thank you.

Note: The ARRL will send you a ballot about October 1st. Your ballot, to be counted, must be received by the ARRL no later than November 19, 2010.Thank you for your time and consideration.

This email is sent in connection with the ARRL West Gulf Director and Vice Director elections, and has been sent by K5RAV and N5AUS, not by the ARRL. If you do not wish to receive future emails in connection with this West Gulf election, please send an email to ARRLElectionEmailUnsubscribe@... and your name and email will

be removed from future mailings.

5032. HamEXPO

Yahoo group: Temple_ARC
Date: 2010-10-04 03:58:19 UTC
From: John Hobson
Topic: 5026 Message: 5032

All,

I would like to personally thank all of the TARC members and VEs that helped on Friday and Saturday setting up and running HamEXPO and running the VE test sessions. I believe this is one of the better HamEXPO's we have held. To me, it looked like it ran very smoothly. I had a number of Ham comment that they appreciated TARC sponsoring HamEXPO and wished to express their thanks for all we did to put it on. I also had several Hams commented that they thought it was very well run and appreciated our hard work.

Great job TARC and VEs. Another success to be proud of.

TARC will sponsor a thank you breakfast this next Saturday, October 9, at the Golden Corral in Temple for TARC members and VEs. Please arrive by 9am. Breakfast will be on TARC. Please look for me to get a voucher for breakfast. I have asked for a long table so we can eat as a group.

If all stays well, I will be there.

We had an outstanding turnout of VE's but the number of candidates was down. Thanks to all that support this major test session.

The high point of this session was the eight year old that passed Technician with a very high score. The very proud grandfather almost had to be tied down. They headed back to the Expo to purchase a new radio.

This is the type of thing that makes being a VE worthwhile.

Once again, a BIG thank you to Mike Rhoden for sponsoring us at the Belton municipal Courts and Police Station facility.

5037. West Gulf Elections Candidates for Director, Vice Director

Yahoo group: Temple_ARC
Date: 2010-10-07 03:03:01 UTC
From: G R
Topic: 5037 Message: 5037

Candidates for Director, Vice Director

I strongly support and highly suggest that any member of TARC that is a ARRL member give your total and complete support to both:

West Gulf Director Dr David Woolweaver, K5RAV,

Vice Director John Robert Stratton, N5AUS

Ballots should be in your mail boxes in the next few days.

Please don't delay once you get the ballot, vote your choice and send it back to be counted on 19 November 2010.

Thanks

Gerald N5ZXJ

HOTARC - Ed Middlebrook, KC5NT Silent Key

The Family visitation will be Thursday, October 7, 2010 from 6-8 pm at the Aderhold Funeral Home (http://www.aderholdfuneralhome.com/) in West.

The funeral will be Friday at 10:00 am at First Baptist Church of West (http://www.fbcwest.com/). The family invites all of the hams to arrive at 9:45 am, introduce themselves as hams to the ushers when they arrive, and be seated together in the church. They may have us all walk in together, too.

5043. West Gulf Division Ballots

Yahoo group: Temple_ARC
Date: 2010-10-17 02:21:19 UTC
From: Rocket
Topic: 5043 Message: 5043

Have you received your Ballot for the West Gulf Division Election????

If you have received it, was the Ballot in the envelope??

Many ballots were sent out with the Ballot missing.

If you are one of those that did not get the Ballot....

SEND AN EMAIL TO ARRL As Soon As Possible!!!!!

If you have not received the Ballot, please post a note here.

I know of at least 20 Ballots mailed with no Ballot in the Envelope

Thanks

Gerald

5044. Reply from the ARRL on missing Ballots

Yahoo group: Temple_ARC
Date: 2010-10-17 02:48:16 UTC
From: Rocket
Topic: 5044 Message: 5044

Here is a reply from Dave Sumner K1ZZ, ARRL Secretary about missing ballots.

Gerald,

We have received several reports of ballot mailings to ARRL members in which the member did not find a ballot enclosed. Any member who did not receive a ballot in his or her mailing is asked to please contact either me or Lisa Kustosik, KA1UFZ (lkustosik@...) so a replacement can be sent. Do not mark a vote on anything other than an official ballot. We apologize for the inconvenience and will send your replacement ballot on Monday.
If a member has not received a ballot mailing at all by October 30, he or she should contact us immediately afterwards for a replacement package. Replacements are sent by first class mail, so there will still be plenty of time for the round trip prior to the November 19 deadline. If a member's travel plans require that the replacement be sent earlier we will be happy to oblige.

73,

David Sumner, K1ZZ

Secretary, ARRL

5049. Interference on 147.300

Yahoo group: Temple_ARC
Date: 2010-10-20 22:03:16 UTC
From: mah197018
Topic: 5049 Message: 5049

During coffee today it was discussed that there is a pager sounding interference on 147.300 and James Coleman would like help in finding the source.

I called Scott & White since they have a clinic next door to the tower where the repeater is located in Belton and asked them to check with their communications department for any recent changes. They created a help desk ticket to send to the department.

Later I looked the problem up on the internet and found this interesting article to share from "Repeater-builder" Yahoo group.

Copy of message follows:
One possible cause of continuous carriers at sites with several
transmitters is a sloppy technician who doesn't bother to replace all of the shields after performing maintenance. Check around to see if nearby stations have every shield installed, with all of the screws properly tightened. Has any work been done recently on nearby stations? CASE IN POINT: Several years ago, I was seeing a continuous carrier on the input of a 2m repeater, at 147.900 MHz. Using T-Hunt equipment, I tracked down the culprit at a hilltop nearly two miles away. Another Ham was working on his 70cm MICOR repeater, and had left off the shields on the exciter shelf. His station operated at 443.700 MHz, which means the exciter was running at 147.900 MHz, since UHF MICOR stations use a VHF exciter followed by a tripler. He had jury-rigged the exciter to run all the time, to minimize the key-up interval. Once he buttoned everything back up, the leakage was undetectable. We live and we learn...
73, Eric Lemmon WB6FLY

So, if anyone can help out by finding what may be a "Pager" tower transmission, please let us know and we will find a solution.
THANKS

Ki5M

Here in Azle, Texas we have been fighting noise on the input (147.76) of the local repeater. Apparently the FC has gotten involved because it was hitting some commercial frequencies also. It looks like what they found was some very dirty 900 MHz SCADA equipment involved with gas well operations. We still have interference from time to time but it's getting better.

5055. Saturday mini-VE test

Yahoo group: Temple_ARC
Date: 2010-10-23 17:40:09 UTC
From: Joe Dorn, W5VEX
Topic: 5055 Message: 5055

The Saturday mini-VE test session resulted in three new Technician and one new Extra class licenses.

Priscilla Beauregard, KE5UES achieved her Extra class License

The new Technician's are:

Frank Gordon Copperas Cove

James Lee Granger

Ramona Rodriguez Temple

The VE's assisting were:

Ross and Jan Gregg

Gerald Richmond

Joe Dorn

Priscilla Beauregard (Priscilla acted as a VE during the Technician test and then sat for her Extra test)

Thanks to all

Also thanks to the other VE's that offered to help but who were not needed today.

5057. Missing Ballots for ARRL Election

Yahoo group: Temple_ARC
Date: 2010-10-24 05:21:05 UTC
From: bosshardss
Topic: 5057 Message: 5057

received on 10/14 from David Sumner.

ARRL candidates:

As of this afternoon we have received reports of 8 cases of ballot mailings to ARRL members in which the member did not find a ballot enclosed. Should you hear from a member that he or she did not receive a ballot in their mailing, please have them contact either me or Lisa Kustosik, KA1UFZ (lkustosik@...) so a replacement can be sent to them. Ask them not to send a vote marked on anything other than an official ballot.

A total of about 37,500 ballots were mailed, so 8 is not an alarming number although it is more than I would like to see.

If a member has not received a ballot mailing at all, please ask them to wait until October 30 and then to contact us immediately for a replacement package if it still has not been received. Replacements are sent by first class mail, so there will still be plenty of time for the round trip prior to the November 19 deadline. If a member's travel plans require that the replacement be sent earlier we will be happy to oblige.

73,

David Sumner, K1ZZ

Secretary, ARRL

Subject: [TARC] Christmas Party, December 2, 2010 reservations

Anyone who would like to make a reservation for our Christmas Party dinner can e-mail me at ki5m@... or send a message to board@tarc.org

The cost for members and their guests is $5 per person.

You can pay at the door.

I will also accept membership payments for the year 2011 at the door for those who wish to pay at the party also.

Senior rate for 65 and above $15 cheap.

Full member rate below 65 yrs age is $20.

Payments are listed on the club site and may be made by PayPal from this link:

http://www.tarc.org/paypal_dues.htm

Mike Hankins,ki5m

Club Treasurer

5065. Temple Christmas Parade

Yahoo group: Temple_ARC
Date: 2010-11-15 01:48:32 UTC
From: myronmesecke
Topic: 297 Message: 5065

That time of year again everyone. I'm in need of volunteers to work the staging area of the Temple Christmas parade. The date is Monday December 6th.
I can use your help even if you don't have a radio.
We will meet up the afternoon of the 6th at 2:30 P.M. with staging starting at 3:00 P.M.
Things will get busy after 4:00 P.M. so even if you can't make it at 2:30 still come out.

So far I have 6 people signed up to work. Don KE5NNV, Darwin K5DOA, Walter KE5DPS, Ron W5WRE, David KE5NQK and myself. I could really use an additional 6 people for a total of 12.

Anyone who has worked the parade in the past knows that non parade related traffic in the staging area is the biggest problem. I really want to have enough people so the avenues that go through the staging area can be manned at the intersections on 6th and 10th streets.

There are parade entrants that line up on these avenues so they can't be completely blocked off. That means they need to be manned for proper traffic control.
These positions on 6th and 10th streets can be manned from inside a vehicle if necessary. You would just have to get out when traffic approaches.

The parade starts at 6:30 P.M. Volunteering about 5 hours can help make the parade a success and brighten the faces of many children.

Email me if you can help.

Myron,
Does the club have reflective vests. If not can some be purchased before the parade?

Thanks,
Walter. Ke5dps

The club does not have any reflective vests. The club does have some bright orange cloth with zippers vest that were bought quite some years ago. I forgot to bring them to the last club meeting. The TARC board decided that we will give them away to clear inventory since they don't meet guidelines. I have them at my house and will bring them to the parade as a backup.

A couple of the club members mentioned that Harbor Freight in Temple has safety vests for just a few dollars. I will ask the board about buying some and having them become the property of each club member that gets one. In a sudden emergency having to get vests out of the storage container and distributing them doesn't make sense. Then there is always the size issue too. Always seems someone needs a smaller or larger size than what the club has on hand. At least that is the way it seems to work with the T shirts.

OK by me. It would only be fair for the member to volunteer at an event to receive a vest.

I vote yes on the purchase of the vests, for volunteers to keep in their vehicle, and if the rest of the board agrees, those who do purchase a vest in November (for use in the parade) can bring the receipt to the club meeting between now and January 3rd
IF APPROVED BY THE BOARD.

Myron, if you are getting these from Harbor Freight, please get a few extra for the next parade also.
Mike Hankins, KI5M.

CONGRATULATIONS!!!!

West Gulf Division

Current ARRL West Gulf Division Director Dr David Woolweaver, K5RAV, of Harlingen, Texas, faced Larry Essary, K5XG, of Lucas, Texas, in the West Gulf Division Director race. With 2387 votes, Dr Woolweaver was declared the winner; Essary received 1262 votes. Dr Woolweaver previously served as Vice Director from 2000 to 2009 and became Director upon the resignation of Coy Day, N5OK.

Incumbent West Gulf Division Vice Director John Robert Stratton, N5AUS, of Austin, Texas, squared off against challenger Michael Reynolds, W0KIE, of Tulsa, Oklahoma. Stratton won the race with 2427 votes; Reynolds had 1203 votes. Stratton was appointed Vice Director in August 2010, after the resignation of John Thomason, WB5SYT.

I just saw on the news that Pat Sirois (his callsign escapes me), a former TARC member, was killed in a roadside accident in Oklahoma while enroute back to Fort Hood. He was a Fort Hood police officer. Pat was stationed at Fort Hood a few years ago and was active in TARC. He was transferred to Fort Bliss and promoted to Sargeant Major, later retiring from the Army and becoming a police officer. If you knew Pat, you knew him as a genuinely nice man.

I am very sorry to hear about Pat's death. Pat made at least two Field Days with us. My last mental image of him was him on top of the pavillion at the tractor grounds helping us set up an antenna. He was a good guy and will be missed.

5079. Temple Christmas parade update

Yahoo group: Temple_ARC
Date: 2010-11-29 02:24:52 UTC
From: myronmesecke
Topic: 5079 Message: 5079

The parade entrant line up meeting is Monday November 29th if anyone is interested in attending. The meeting is at 6:00 P.M. at the Frank Mayborn center.

The meeting is for the drivers of the vehicles and floats that will be in the parade. The drivers are told the rules and line up instructions at this meeting.

It is not necessary for any TARC volunteers to attend but it is a handy way to learn what the drivers are supposed to do which might help with our staging duties.

The instructions I will be emailing to everyone and also handing out on Monday December 6th will have the important items listed so going to the line up meeting is completely optional.

I have a total of 7 people signed up to work the parade. If there is anyone else who wants to help please let me know.

5085. Temple Christmas parade instructions

Yahoo group: Temple_ARC
Date: 2010-12-02 02:44:52 UTC
From: myronmesecke
Topic: 5085 Message: 5085

I have uploaded to files into the TARC files folder. One is a word file of the instructions and the other is a pdf of the staging area.

On the staging area map there are red circles at intersections on 8th street and orange circles at the intersections on 6th and 10th.

The 8th street circles at Barton, Calhoun, Downs and French need to be manned along with the 6th street circles at Barton and Calhoun. There are only a couple of entrants on 8th between French and Garfield. ^th and Barton and 6th and Calhoun seem to be the two intersections where most of the non parade cross traffic originates. These need to be manned to stop non parade traffic from entering the staging area.

Those four 8th street and two 6th street intersections take up the 6 volunteers I have to work the parade with me acting as a rover up and down 8th.

I will have printed copies of these two files with me on Monday or you can print them out yourself.

See all the workers Monday afternoon at 2:30 in the rear parking lot of the old Lanier elementary school. School is on 8th between Barton and Calhoun.

Myron
N5TFK

5092. Gerald Richmond's (N5ZXJ) Brother

Yahoo group: Temple_ARC
Date: 2010-12-22 12:30:34 UTC
From: Joe Dorn, W5VEX
Topic: 5092 Message: 5092

BCC'd to a bunch

Gerald Richmond's (N5ZXJ) brother died last Sunday as a result of injuries from an earlier motorcycle accident. I met Steven only a few times but because of my close relationship with Gerald over the past several years, it is almost like losing a family member. Please keep Gerald and his family in your thoughts over this holiday season.

Steven Michael Richmond

Steven Michael Richmond, age 40, of Temple died Sunday, December 19, 2010 in a local hospital. Mass of Christian burial will be celebrated at 10:00 AM Thursday, December 23, at St. Luke's Catholic Church with Rev. Don Loftin as celebrant. Burial with military honors will follow at Central Texas State Veterans Cemetery. Visitation will be 6:00 - 7:00 PM Wednesday with a rosary at 7:00 PM at Scanio-Harper Funeral Home.

Mr. Richmond was born on November 16, 1970 in Cleveland, Ohio to Jerry and Elizabeth (Betsy) Klaus Richmond. The family moved to Temple in 1974. He was 1989 graduate of Belton High School. Shortly after graduation he enlisted in the U. S. Marine Corps and served in the Gulf War. After leaving the Marine Corps in 1996, he attended ITT Technical College in Austin where he graduated first in his class with an associates degree in Electronic Engineering. He was later employed at Cirrus Logic in Austin for five years and later with his father at Jerry's Radiator Shop in Belton. He married Silvia Saenz on September 29, 2002 in Temple. Steven was a member of St. Luke's Catholic Church as well as the Marine Corps League, VFW, American Legion, Knights of Columbus and HOG (Horny Toad Chapter).

Survivors include his wife, Silvia Richmond, a son, Joshua and a daughter, Isabella, his parents, Jerry and Betsy Richmond, a brother, Gerald Richmond and mother-in-law, Rosa E. Toruno all of Temple and numerous aunts, uncles and cousins.

Visitation is 6-7 p.m. today at Scanio-Harper Funeral Home in Temple followed by a rosary.

Oops!

I see that there is an error on p. 1 of TARC Bulletin for January. The photo of President John Hobson receiving a Leadership Appreciation Award says he was the "Ham of the Year." That is wrong, because this honor went to our well-deserving director and new Vice President Myron Mesecke, N5TFK.

Sorry 'bout that.

Mike, I'm going to send my dues to the PO Box. I hope it's still Box 616.

For some reason I haven't been able to access the TARC Bulletin for the last year. Don't know why. Even though I can't make the meetings, I would like to know what's happening. Can you offer any suggestions?

Hope you have a Happy New Year.

From: John Hobson
Topic: 5089 Message: 5099

TARC Members,

This is a reminder. The next TARC meeting will be this Thursday, January 6.

Would you like to know what the January TARC meeting has in common with the Opera Show? You will have to be present to find out and I don't believe you will be disappointed.

I hope every one had a great Christmas and New Years.

Hope to see you this Thursday evening.

73,

John WD5BFS

On behalf of the Temple Amateur Radio Club and want to thank all of you who have already sent in your membership by Pay Pal or by sending a check to:
Temple Amateur Radio Club, Inc.
P.O. Box 616
Temple, TX 76503

A couple of you have even made DONATIONS in addition to the membership. Many thanks, and the extra will be used for coffee, donuts and other snack as requested from your enclosed letter.

I would like to state that those coming to the club meeting, that I actually prefer a check instead of cash, which will also be a receipt for you and the club gets a printout of all checks that I deposit.

I have another function to be at on Thursday in Temple, but will come to the club meeting as soon as I can get away. See you there !

Oh, don't forget that those who can not make it can go to our web page:
http://www.tarc.org
and use Pay Pal to keep your membership active.

HAPPY NEW YEAR !

Mike Hankins, Ki5M@...

Club Treasurer

Attachments: 1 described; binary payloads are missing from this source WARC

I have arranged with Mike Rhoden, W5MIK, for the Belton Police facility to be available for VE testing in concert with the Ham Expo on 2 April. The handout for the last session should also work for this one, as attached.

This is usually our biggest session of the year and we need a lot of VE's.

Please thank Mike Rhoden and the City of Belton for letting us use this facility.

From: Darwin Geiselbrecht
Topic: 5120 Message: 5123

Extra Class begins Monday

I finally got word from the church that our reservation for the room has

been approved for Mondays and Thursdays beginning next Monday Feb 21. We

will plan on ending on March 21 unless we need some extra time. We will not

have a class on the night of the club meeting, March 3. Class will be from

7 to 9 PM at the church. Mondays and Thursdays were chosen based on

discussion with some of you guys to avoid conflicts with CTARC and Bell

County meeting activities on our more normal Tuesdays.

I need to know who needs books. I have two of the larger Extra Class

books and two of the Q&A manuals available for sale at the club cost. I can

order more of either if needed.

Please let me know if you are interested in taking the class. I have Walter, Gil, Robert KE5WVC, and
Kenneth Watkins signed up so far.

Robert KE5WVC, I got a bounce from your email at Embarq. Please reply to this if you get it.

73 - Darwin K5DOA

PS. Mike will be teaching the General class on the same dates and times.

We are looking for someone, or a few to share time with individuals to answer their questions on ham radio and pass the technician test.

From our president:

"We had a good Skywarn session today. I had 5 people sign up as being interested in a Technician class."

If you are willing to lead a technician class, go through the questions in the book and answer any questions they have please let me know and I will proved extra material to you.

Darwin is doing the Extra class and I have the General class, so we need a volunteer or two. You can decide which days to meet.

It looks as if the Extra and General classes will start on a Monday this time, Feb 21.

Subject: [TARC] Extra Class begins Monday

Extra Class begins Monday

I finally got word from the church that our reservation for the room has been approved for Mondays and Thursdays beginning next Monday Feb 21. We will plan on ending on March 21 unless we need some extra time. We will not have a class on the night of the club meeting, March 3. Class will be from 7 to 9 PM at the church. Mondays and Thursdays were chosen based on discussion with some of you guys to avoid conflicts with CTARC and Bell County meeting activities on our more normal Tuesdays.

I need to know who needs books. I have two of the larger Extra Class books and two of the Q&A manuals available for sale at the club cost. I can order more of either if needed.

Please let me know if you are interested in taking the class. I have Walter, Gil, Robert KE5WVC, and
Kenneth Watkins signed up so far.

Robert KE5WVC, I got a bounce from your email at Embarq. Please reply to this if you get it.

73 - Darwin K5DOA

PS. Mike will be teaching the General class on the same dates and times.

We are looking for someone, or a few to share time with individuals to answer their questions on ham radio and pass the technician test.

From our president:

"We had a good Skywarn session today. I had 5 people sign up as being interested in a Technician class."

If you are willing to lead a technician class, go through the questions in the book and answer any questions they have please let me know and I will proved extra material to you.

Hwy 36 in heidenheimer constuction, the exits have changed a little bit for those who travel that direction. If they exit west for fm 436 they turn right after the exit. But if they want to travel fm 93 they will have to follow service rd to the next exit. Just noticed this. For all those who travel in from cameron way and have never seen the new bridges and intersections.

Colleagues,

Please, if you have not written to your congress person about this terrible piece of legislation, do it now. Here is the best way to do this.

Please do the following:

1) Go to <http://www.kd4pyr.net/hamletter.htm>

2) Enter Your call sign, and press "Request"

3) Print the regenerated letter.

4) Sign the letter with your signature.

5) Mail the letter ASAP to:

From: myronmesecke
Topic: 841 Message: 5139

Come one, come all to the greatest show on earth! Or at least the greatest show this weekend at the Expo center.

We won't need too many people on Friday for set up but Saturday morning we need all the help we can get.

Admission
Raffle
Lunches
Door prizes
Traffic control
VE testing

We need about 4 people from 5:30 AM to 7 AM to help with indoor parking, vendor admissions and help.

We need at least 4 people 7:00 AM to take admission at the front door. It works easier if taking money, stamping hands and handing out raffle tickets are done by different people. Keeps the line flowing.

We need at least 2 people to man the raffle barrel starting at 7:00 AM. You will take raffle tickets as they are turned in and also sell additional raffle tickets.

We need someone to collect door prizes from the vendors that are donating. Need this completed by 8:30 AM.

Lunches will need to be handed out at 10:30 AM This is usually a three person job. One for the lunches, one for the drinks and one to check off list and help.

If you want to help with VE testing contact Gerald N5ZXJ.

I ask for everyone's help in assisting with traffic control. Please keep your eyes and ears open and help vehicles leave the building.

I will have printed instructions for all of these tasks.

Myron

The Temple Amateur Radio Club (TARC) is now accepting membership dues.
Don't know what to give your spouse? Know anyone who needs more friends? Sixteen people have already paid for membership renewal.
You can pay yours through pay pal at this link:
http://www.tarc.org/paypal_dues.htm
or come by to the meeting with cash or check.

The sooner you pay, the more meetings, activities, and longer bragging rights that will enjoy, to say that you are a member of the Temple amateur radio club !

ALL HAMS INVITED to bring a friend or two.
See you soon.

Merry Christmas !
and a Happy New Year "2011" to you !

This is a reminder and call for VE's to assist in the Test Session in conjunction with the Ham Expo this weekend. This is usually a large session and all VE's are welcome. Please drop a note to me if you will be available.

VE's assisting in the test session can gain free entrance to the EXPO by showing their VE badges. The participating VE's are also invited to the TARC breakfast for EXPO volunteers, usually the weekend after the EXPO.

If you can assist please be at the Belton Municipal Court and Police Building by 10:30 this coming Saturday. Directions are available at the EXPO desk.

F.Y.I. -- the Lifetime TARC membership of Roy C. Walker, W5FOE has expired; he is a Silent Key.

-- Mike WA5EQQ

From: mah197018
Sent: Friday, April 01, 2011 10:16 PM
To: Temple_ARC@yahoogroups.com
Subject: Re: [TARC] 2011 memberships

The following are lifetime members:
NU5D Bosshard, Steve Life
N5RXD Grim, Edward Life
WA5EQQ LeFan, Mike Life
AE5AP Olsen, Tom Life
KB5DC Schlieper, Kay Life
W5WDW Starnes, Vernon Life
W5FOE Walker, Roy C. Life

If you wish to become a life member the cost is a payment of
10 years in advance. This is not cumulative of any past membership dues.

Board members have a list of current members at the EXPO location.
THANKS

Mike Hankins, KI5M

5146. Ham Expo Test Session Results; 2 April 2011

Ham Expo Test Session Results

2 April 2011

Each test session has a different mix of types of test given and passed; this one will be remembered for the number of upgrades rather than new licenses. We had a total of 21 people take tests and only had two new Technicians but seven new generals and six new Extras.

The Technicians are:

Bobby Frilloy and Joseph Proctor

Paul Stewart passed Technician, then General

The new Generals are:

James Aprile, KE5JDW

David Carter, KF5NED

James Mortimer, KE5TGL

Jeremy Rymer, KF5IQY

Thomas Snyder, KF5GLM

Paul Stewart, TBA

Eugene Tryba, KC9QHW

And last and not least the new Extras are:

Terry Browning, W5TGB

Michael Owings, N5UST

Sammy Ragsdale, KF5JZJ

Gilbert Rymer, W5GLR

Robert Shoemaker, KE5WVC

Kenneth Watkins, KE5ISN

The support from the VE's was outstanding. To handle sessions this large we need at least eleven VE's and we had fourteen. Several others were available if needed at the EXPO.

Priscilla Beauregard, KE5UES

Teddy Bruski, KE5UET

Sam Clark, WA5DTY

James Cleveland, N5ONI

Joe Dorn, W5VEX

Edwin Garcia, N4EGR

Jan Gregg, W5GNK

Ross Greg, W5ANW

Russell Hardman, KB5RUS

Richard Murray, K6WXA

Michael Rhoden, W5MIK

Gil Rymer, W5GLR

Frank Tyler, K6STU

Kenneth Watkins, KE5ISN

And a great big THANK YOU to Mike Rhoden and the City of Belton for the use of their Municipal Court area for the testing activities.

Since I am a permanently stocked VE Liaison, I can arrange testing for any class of license with a couple of days notice to arrange for another two VE's. Give me a call when ready.

Thanks to all!!!

All Bell County Hams

Please come join us at the April Temple Amateur Radio Club Meeting to hear and visit with our special guest, John Robert Stratton N5AUS, Vice Director ARRL West Gulf Division. John will be updating us on the current legislative lobbing in the Texas legislature being lead by our ARRL representatives and Texas Amateur Radio EmComm Fund project. All Hams in Bell County and surrounding counties are invited and encouraged to attend. This is your chance to have a one on one with your ARRL Vice Director.

To: undisclosed-recipients:
Subject: NWS Update: Active weather on Thursday

Good afternoon,

A very strong weather system will move into the plains late Thursday. This system will be centered across Kansas, but will be strong enough to push a dryline well east into Oklahoma and central Texas Thursday afternoon. Strong to severe thunderstorms will be possible along and east of the dryline, with windy and dry conditions leading to extreme fire weather conditions west of the dryline.

OVERVIEW

Widely scattered strong to severe thunderstorms are expected Thursday afternoon and evening across parts of north Texas. The threat for severe weather will be for areas east of a line from Sherman to Dallas to Groesbeck with the greatest threat across Fannin, Lamar, Hunt, Delta, and Hopkins Counties. Critical fire weather conditions are expected to develop west of a line from St. Jo to Mineral Wells to Cisco where gusty winds develop in areas west of the afternoon dryline position.

IMPACTS

Strong instability and strong vertical wind shear will be favorable for the development of long-lived supercell thunderstorms on Thursday afternoon and evening. Very large hail, damaging winds, and isolated tornadoes will accompany these thunderstorms as they move northeast.

Across the western parts of north Texas behind the dryline, weather conditions will favor the rapid spread of any wildfires that get started.

TIMING

The timing for severe thunderstorms across eastern sections of north Texas on Thursday will be between 4 pm and midnight.
The most critical fire weather conditions across western parts of north Texas will occur between 1 pm and 8 pm.

FORECAST CONFIDENCE

For severe weather on Thursday, our confidence is low to moderate on the development of severe thunderstorms. Our confidence is highest in Fannin, Lamar, Hunt, Delta, and Hopkins Counties.

For critical fire weather conditions, our confidence is moderate to high on the gusty winds and very low relative humidity values Thursday afternoon.

FORECAST POSSIBILITIES

A slower movement or a more southerly track of the Kansas weather system could lead to a substantially greater threat for severe weather across north Texas. At this time, the timing and track of the system favors a severe weather outbreak centered across eastern Oklahoma.

BOTTOM LINE

Emergency Managers, public safety and elected officials across the threat areas should monitor the latest forecasts and weather conditions Thursday afternoon and evening. Spotter activation will likely be needed across eastern parts of north Texas Thursday afternoon and evening.

5160. ARMAD: Amateur Radio Military Appreciation Day

Yahoo group: Temple_ARC
Date: 2011-04-29 14:12:52 UTC
From: Joe Dorn, W5VEX
Topic: 5160 Message: 5160

BCC: My Amateur Radio Lists and several others.

Mike Rhoden, W5MIK, has been very supportive of the local amateur radio community and is now asking for support from us. Mike has been a very active VE and has made the Belton Municipal Courts and Police facility available to us for testing whenever needed. He has started the ground work for Amateur Radio Military Appreciation Day on the Temple VA hospital grounds on May 28th. See his note below for details.

This would be an excellent opportunity for the local amateur radio groups to get some media exposure and also an opportunity to blow the dust off of some of our emergency support gear. The Bell County Reservists, CTARC and TARC could well benefit from the event. If BCRES chooses to participate with their equipment I will bring my ICOM 7200 in its field operational mode for HF support. I can also furnish an 8 KW generator if needed.

I have also copied other ARES related group leaders that might want to participate in their communities.

Most important it would show appreciation for our military personnel, past and present, in a very positive way.

For additional details, check:

Joe,

A friend and I are putting together a plan to support Amateur Radio Military Appreciation Day event on May 28th from 1100 hrs- 1400 hrs. We have secured a spot on the front lawn at the Temple VA. Now we are working on getting the word out and plan to get the media involved. Could you send out an email to your list about this event? We are also looking for volunteers to come out and set up radio equipment. Here is a link <http://www.armad.net/> with information about this annual event.

Thanks,

Mike R.

Hello All,

Someone has a 70 foot tower that can be had for taking it down. It is
located at 1100 Jewel Dr. in Waco. Please call Jamie Morris at 366-5457 to
make arrangements to take it down. It needs to be down in 2 weeks. If you
have some other questions, call me 857-9760.

Subject: State of Texas Governor Issues Military Appreciation Month Proclamation 2011

Good Evening To All,

Please see the attached proclamation I received in the mail today from our Texas Governor, Pick Perry. I am also including two previous proclamations

that were received only a short time ago. This will bring our Amateur Radio Military Appreciation Day proclamations count up to three (State of Texas, City of Temple, and Trinity County Commissioners Court). Our joint efforts are truly being acknowledged for this worthy cause. I hope and trust we will all continue to show our support for our Troops and love for the hobby of amateur radio across our great state of Texas.

For additional information regarding this event, please see the attached flier i.e. ARMAD 2011.

5170. introduction and a question

Yahoo group: Temple_ARC
Date: 2011-05-15 22:44:03 UTC
From: rigg_nathan
Topic: 5170 Message: 5170

Hi My name is Nathan Rigg my call is NR5P. I have attended a couple club meetings but has been probably 5 years or so. I would like to be more involved but it seems every meeting date something comes up. I will try this month again. I do need some help and don't know if anyone is set up to help me or not. I have a boonton 91c it's an old rf millivolt meter. I had to replace the 12ax7 in it and get a new test probe. It is the correct probe but not the matching serial number, so I'm sure it's off of calibration now. Is there anybody that has an accurate signal generator source that I could get this calibrated? I don't mind paying for somebody to do it or helping me out. Also if anybody knows a place close by that still works on these that would be great to. I don't want to ship it but would drive a ways to have it callibrated.

Thanks, Nathan NR5P

Mike.

I believe most of the folks responding will be self contained as far as equipment needs.

I have not heard anything from the leadership of the BCRES or TARC as to what their plans are but Dennis Baker was very supportive of the event. I am going to visit Dennis this week to check on the status.

If you would send me the details of what you have planned and the location at the VA so that I can forward it to the interested parties.

FWIW, I have had several folks respond from Bell and Coryell Counties.

5175. Tour d' Temple Bike Rally

Yahoo group: Temple_ARC
Date: 2011-05-24 01:35:12 UTC
From: myronmesecke
Topic: 5175 Message: 5175

Saturday June 4th
Meet at 7:00 A.M.
Rally starts at 8:00 A.M.
Cultural Activities Center in Temple (next to Mayborn Center)

Due to construction taking place on several roads the routes will be changed from what everyone is used to in the past. Kiwanis is hoping to keep all the routes east of FM 317 this year. No Mother Neff Park!

There are preliminary routes but these are not set in stone, or in pavement. A couple of the roads are gravel so routes are still being finalized. But I wanted to release the preliminary routes so that everyone can get an understanding of the area the bike rally will be in.

Go to Files and look for the Tour d' Temple Folder. The maps of the 4 routes are there. *Remember that these are not the final routes* This is just to get a feel for where the routes will be.

We might have a busy time. The number of lost riders due to the new routes and broken down bikes due to unforeseen road hazards might be up this year. Since the bike rally takes place a couple of weeks later this year heat exhaustion might also be a concern.

I don't know how detailed the maps of the routes may be. If you have a good county map to carry with you it might come in handy if you need to call in assistance for a rider.

I will post more info as it becomes available.

Ask every ham you talk to if they would be willing to help out.

Myron

From: William Bunting [mailto:William.Bunting@...]
Sent: Tuesday, May 24, 2011 11:15 AM
To: undisclosed-recipients:
Subject: NWS Update: Severe Weather Outbreak Today

The ingredients for a significant severe weather outbreak continue to come together this morning, and we expect severe thunderstorms to develop across western North Texas after 3 pm and move across much of North Texas during the late afternoon and evening hours. While the threat of severe weather exists over most of North Texas, the area of greatest threat exists along and north of Interstate 20. All types of severe weather will be likely today, including tornadoes, very large hail, and damaging downburst winds. Long-track, strong tornadoes are possible. In addition, localized flash flooding will be possible. A multimedia web briefing will be available shortly on our web page, and a graphic is attached depicting the threat areas today and tonight.

OVERVIEW/TIMING...An intensifying surface low pressure system over the northern Texas Panhandle will move northeast as a powerful upper level storm system moves across the southern and central plains states later today. The atmosphere over North Texas is already very unstable and with daytime heating the instability will only increase. The dryline, located over West Texas this morning, will move east and serve as the focusing mechanism for thunderstorm development by mid to late afternoon. This is expected to occur roughly near or just west of a line from Olney to Eastland, Comanche and Goldthwaite. Thunderstorms should become severe quickly and move northeast at 35 to 40 mph, posing a challenge for mobile storm spotters. As often occurs with supercell storms, the initial storm will split into two storms, one that slows and turns to the right (east), and a left-moving storm that then accelerates to the north-northeast and poses a very large hail threat. Conditions today will favor a few splitting storms, and spotters and emergency managers should be prepared for possible complex storm evolutions for local warning purposes.

With time, initially isolated thunderstorms should merge into one or more lines of storms while continuing to move northeast tonight. The primary severe weather threat will then become damaging straight-line winds, with tornadoes and large hail still possible. Rainfall may locally exceed 1 to 2 inches and will pose a risk of flash flooding.

On Wednesday, thunderstorms will be possible across eastern North Texas, mainly to the east of I-35. There will be some threat for severe storms, although the details are still uncertain and will be influenced by storms today.

CONFIDENCE...Confidence in severe storm development today is high, and moderate on the location of initial storm development. We will refine this forecast throughout the day.

We will launch a special balloon sounding at 1230 pm to sample the pre-storm environment. The Storm Prediction Center will upgrade northern portions of North Texas to a High Risk later this morning and extend the moderate risk area a bit farther south.

5177. 'Amateur Radio Military Appreciation Day' 28 May 2011 at th e Temple VA Hospital

Yahoo group: Temple_ARC
Date: 2011-05-27 13:28:57 UTC
From: Joe Dorn, W5VEX
Topic: 5177 Message: 5177

Tomorrow, 28 May, is 'Amateur Radio Military Appreciation Day' and for the first time this part of Central Texas will be participating. We invite everyone to attend, especially amateur radio operators.

The event will be at the Temple VA Hospital near the line of flags. Set-up will begin at 09:00 with formal proclamations at 11:00. We should be finished by 14:00.

The Bell County Reservist will have some of our emergency response equipment set up.

We hope to turn this into an annual event since the military is such a big part of our area.

There will be some activity on EchoLink, I currently do not know the node. The Salt Grass Trail net will be involved also.

A list of HF frequencies is below this part of the note.

Hope to see you there.

5180. Bike Rally this Saturday

Yahoo group: Temple_ARC
Date: 2011-06-01 00:47:51 UTC
From: myronmesecke
Topic: 5180 Message: 5180

This Saturday June 4th at 7:00 A.M.
Cultural Activities Center in Temple

The Temple Kiwanis does not yet have the route maps available on their web page.

It will be hot so bring whatever supplies you feel are necessary. Hats, liquids, etc.

With the new routes and the heat the riders will be depending on everyones support more than in recent years. Let's not let them down.

Everyone is invited to help, even if you can't work the entire length of the event.

Myron N5TFK

5181. TARC Meeting - It's a Pizza Party!

Yahoo group: Temple_ARC
Date: 2011-06-01 02:46:07 UTC
From: John Hobson
Topic: 5181 Message: 5181

TARC and Local Hams,

Everyone is invited to come hungry to the June TARC meeting this Thursday evening at 7PM. It's a "Pizza Party" on TARC. Non-TARC members are invited to join us.

For our program we will be discussing plans for the TARC Field Day site.

See you there and come hungry.

73,

John

5185. RSVP re Field Day - I'll be out of town

Yahoo group: Temple_ARC
Date: 2011-06-03 02:54:42 UTC
From: David Carter
Topic: 5185 Message: 5185

I wanted to attend Field Day but came home, checked the calendar, and found I'll be in Knoxville & Memphis, TN, Thu-Mon 22-27 June for family reunions. Wish there wasn't the conflict.

5190. TARC Field Day

Yahoo group: Temple_ARC
Date: 2011-06-23 23:38:28 UTC
From: John Hobson
Topic: 2323 Message: 5190

CQ Field Day CQ Field Day

This is a reminder for all TARC members of Field Day this weekend from Noon Saturday to mid-morning Sunday.

All amateur radio operators and anyone interested in Amateur radio are invited to join TARC for Field Day at the Texas Early Day Tractor & Engine Fair Grounds in Temple.

Darwin K5DOA is bringing the fixings for a Bar-B-Q dinner Saturday evening about 6:30 PM. It would be great if TARC members would bring a desert to share.

For those worried about the temperature, I am working on acquiring an industrial evaporator cooler to keep the radio operators cool.

Darwin and I will pick up TARC equipment Saturday morning. We need some TARC members to meet us at the Field Day site around 9AM to help us set up antennas, tables, generator, cables and radios. We also need help Sunday morning to take everything down and store our equipment back in our storage shed.

Hope to all of you all there.

73,

John WD5BFS

5194. TARC Field Day BBQ This Afternoon (Sat)

Yahoo group: Temple_ARC
Date: 2011-06-25 19:49:09 UTC
From: Darwin Geiselbrecht
Topic: 2323 Message: 5194

We are going to have a huge amount of BBQ left over if someone doesn't help us come eat it. So bring the family and join us at the
TEDTEA field day site on Eberhardt road in northwest Temple. We will eat at 6:30.

The wind is up and the pavilion is providing lots of shade so the highest temperature you will encounter will be when you get into your car. It is not bad at all out there this year. Please join us.

5198. July 4th Parade

Yahoo group: Temple_ARC
Date: 2011-07-03 14:33:50 UTC
From: Darwin Geiselbrecht
Topic: 5196 Message: 5198

Once again, it is nearing time to help line up the entrants in the big July 4th parade tomorrow in Belton. This is a good opportunity to use our communications gear for a good cause.

I know most have helped in years past. For those who are new to the process, this is a communications exercise using hand held transceivers. If you don't have a handi-talkie, come anyway and we will pair you up with someone who does. We will use the N5DJJ Belton repeater on 147.3 with a 123 PL tone. This has always given us excellent coverage.

We will meet Monday July 4 a few minutes before 8AM. Matt, the parade official, said he would meet us at 8. We will meet at our usual spot in the parking lot that is at the first left off 10th street at the main entrance of Mary Hardin Baylor at the corner of 10th and 317. Matt will have maps and lists available then. The parade line up will follow the usual paths, one through the campus and one on Industrial north of the bridge off 317.

Matt has promised us 5 golf carts, so if you have a limitation concerning standing or walking, we should be able to get you in a cart.

If you have high visibility safety vests, please bring them. Otherwise, I believe Matt will have some available.

We will help with the line up as soon as deployed shortly after 8. The parade will roll at 10.

Of course bring a big hat and long sleeves, no clouds in sight. I believe Myron is bringing some of the club water and there should be plenty available from the Chamber of Commerce. As far as the heat is concerned, we will be complete by about 11AM before the worst part of the day.

Of course we welcome the participation of CTARC members who make a valuable contribution to several of our outings. Please post this to any CTARC reflectors.

Thanks in advance for your help and see you tomorrow. 73 - Darwin K5DOA

5210. Need help with storage container preparation

Yahoo group: Temple_ARC
Date: 2011-07-30 22:33:11 UTC
From: myronmesecke
Topic: 5210 Message: 5210

Tex Blast is going to be sand blasting and priming the club's storage container this Monday August 1st. The side of Steve's storage container that faces ours needs to be covered so that over spray does not get on it. We don't want to have to paint both of them.

The club has two tarps and I have two more from John Hobson. That should be enough for that one side. I will buy some rope.

I need some help getting the tarps in place. I can bring a 6 foot step ladder and an extension ladder.

If anyone can meet me out at the storage container Sunday evening around 6:30 or 7:00 P.M. let me know.

Email me at meseckem@... or call me at 770-0529.

Thanks.

Myron

Okay everybody, the hard part is done. Once it gets a little cooler it will be painting time. There are two holes in the left door that will need patching. One is small, the other one is about the size of a 50 cent piece. Both long sides have a few pin holes that need patching too. The roof has a fair number of pin holes and will need a little more attention.

Anyone with welding gear or experience please step forward.

A little bit of sand did get inside the container. Maybe a leaf blower would be good to use to clean it out.

5221. Ham Expo Amateur Radio Test Session **** ALL VE'S PLEASE READ, THERE IS A TIME CHANGE...****

Yahoo group: Temple_ARC
Date: 2011-09-22 22:28:18 UTC
From: Joe Dorn, W5VEX
Topic: 5221 Message: 5221

BCC:VE List

There has been some confusion on the time and location of the VE Test session in conjunction with the upcoming Ham Expo on ! October.

The Test Session will be at the Belton Police Station as usual, Mike Rhoden, W5MIK, had a trip planned that was cancelled so we were able to get back into the location.

ALSO THE TIME OF TESTING HAS BEEN CHANGED AT THE REQUEST OF THE TEMPLE AMATEUR RADIO CLUB TO 9:30 AM.

This is so that the new hams or upgrader's can do a little shopping at the EXPO. I expect testing will be finished by 11:00. I will release the VE's as quickly as possible so that they can spend some time at the EXPO post-testing.

I will need the VE's at the police station by 09:00 for set-up.

A new map and info page will be out in a day or so.

Please respond if you will be available to assist with the testing.

Ham Expo Amateur Radio Test Session

The Temple Amateur Radio Club sponsored Ham Expo will be on October 1st the Bell County Domed Stadium; in conjunction with the Expo, amateur radio tests will be given at the Belton Police Station sponsored by the Central Texas Amateur Radio Club.

The police station is located at 2nd and Birdwell (about a block west of the Belton Burger King hamburger joint). The testing will begin at 9:30 AM and end when all applicants have been tested, probably around 11:00 AM.

Since the test session is in conjunction with the very popular Ham Expo, we expect between 25 and 50 people taking the tests. This requires at least 10 Volunteer Examiners to properly staff the event. The VE's participating should be on site by 09:00.Both General and Extra VE's are needed since all test levels are made available. Directions will be available at the Expo registration desk.

This is a 'Ham Community' effort and all area VE's are needed and most welcome to participate. If you will be able to participate, please send an Email to jbdvex@....

People taking the test do not need to register before hand, just show up at test time. For potential new hams, be aware that the 'General Test' pool has

changed and the most current study materials are recommended.

Joe

I am ARRL certified as a VE. I can only test Technitions. If you don't get better offers let me know. Pat and I will be at the Hamfest anyway. Just give me a call if I need to come over. My cell is (254) 466-0694.

Be glad and honored to help.

Subject: [TARC] HamEXPO This Saturday

TARC Members,

This is a reminder that HamEXPO is this coming Saturday, October 1st. As always, we need your assistance is running this event. Please come out and help if you can. We especially need help from 6:30 to 10 AM to assist with final setup and entrance.

Hope to see you there.

73,

John WD5BFS

From: Darwin Geiselbrecht
Topic: 5224 Message: 5233

My busy time as usual will be tomorrow (Friday). So I could sure use my usual helpers, especially from noon until about 4 PM to mark the tables and get the initial rush settled in. Anyone else is sure welcome to come to help and learn the drill.

73 - Darwin K5DOA

5236. Fall Ham EXPO VE Testing Info...

Yahoo group: Temple_ARC
Date: 2011-09-30 16:11:59 UTC
From: Joe Dorn, W5VEX
Topic: 5236 Message: 5236
Attachments: 1 described; binary payloads are missing from this source WARC

Tomorrow (Saturday) is the TARC Fall Ham Expo and thus our next VE testing event.

At the request of the Temple Amateur Radio Club, I changed the test time to 09:30: this has created a problem in that some of the TARC VE's also help at the EXPO Center. I need 10 VE's to conduct the test properly and thus have a need for non-TARC VE's to assist more so than normal. I am requesting that the TARC VE's show up at the BPD, but I will release them if not needed. I will also release VE's as soon as possible after the initial flush of testing is over.

I need the VE's at the Belton Police Department by 09:00 for set-up and head count. Directions and details are in the attachment.

Participating VE's may gain free admission to the EXPO by showing their VE badges. (As they say on TV, A $5.00 value.)

All Participating VE's are also invited to the TARC breakfast at the Temple Luby's on the 8th of October.

Thanks for your assistance in this event.

Joe B. Dorn, W5VEX

Subject: [TARC] Members may vote by mail

I have placed the ballot for 2012 officers on the base "Files" section of the Yahoo Groups (Temple_ARC) website.

Those who are current 2011 members (for 90 days or more) may come to the club meeting to vote, or print and mail in the ballot.

Ballots must be received at the club P.O Box prior to the date of the meeting. Address is on the ballot.

If mailed, you pay the postage !

((73))

5260. Temple Christmas Parade Monday December 5th

Yahoo group: Temple_ARC
Date: 2011-11-29 02:29:17 UTC
From: myronmesecke
Topic: 5260 Message: 5260

The parade is one week away. I could use all the help I can get. TARC is responsible for the staging area on 8th street. The Chamber of Commerce Red Carpet Ambassadors will also be working the staging area but they will be split working the dignitaries on 6th street and the staging on 8th. I need at least 6 people. An HT is helpful but not a necessity. The staging area is 6 blocks long.

I want to have at least one person per block. As an example, the person in charge of the block between Barton Avenue and Calhoun Avenue needs to position themselves at the intersection of 8th and Calhoun to intercept parade entrants that are lined up on that block. Walk them to their position and then return to the intersection.

I have uploaded an instruction sheet. Under Files go to TARC Files and find Christmas Parade 2011.

I think everything that anyone needs to know is there.

There is also a pdf map of the staging area. This file is titled Christmas Parade.

Early forecast for Monday the 5th is mostly sunny, high of 53. Let's hope that forecast holds.

Myron

5264. Christmas Parade

Yahoo group: Temple_ARC
Date: 2011-12-04 21:13:43 UTC
From: myronmesecke
Topic: 1044 Message: 5264

As of 3:00 P.M. Sunday afternoon the forecast for Monday is as follows. A 60% chance of rain in the morning. That chances to a 30% chance of rain in the afternoon. By 6:00 P.M. the chance of rain drops to only 10%. So it should be dry by parade time.

However it will be cold and windy. The high is only 43. But with the cloud cover the temperature will not drop after the sun goes down. The low at 9:00 P.M. will be 41.

Winds will be 15 mph with gusts to 21 mph.

I have made a Temple Christmas Parade folder under files here on the reflector. Instructions and maps are there. I will bring some copies but if you want to print your own feel free to do so.

Bring cold weather gear and perhaps rain gear.

See everyone at 2:30 P.M. in the back parking lot of the Bell County Health building which is the old Elementary school located between Barton and Calhoun Avenues on 8th. street.

BCC: SKYWARN list and others

Frankie Baugh: Please contact me via radio or phone

I have forwarded the latest from Mark Fox about weekend weather; there has been a NWS update that includes Bell and adjacent counties in the snow possible category. Don□t start counting snowflakes yet Great Big Grin! Mark□s comments are after my signature line

I have copied a little bit from the SkyWarn Manual about winter weather. From my perspective any solid precipitation, slush or accumulation should be reported.

Winter Weather

..Report any occurrence of freezing rain, ice accumulation and damage.

..How much heavy snow accumulation is there and is there any damage?

..Do blizzard conditions exist: winds 35 mph or more AND visibility ¼ mile or less?

The link to the entire SkyWarn Manual, a big download, is:

...ACCUMULATING SNOW POSSIBLE ON CHRISTMAS EVE...

AN UPPER LEVEL LOW PRESSURE SYSTEM WILL MOVE ACROSS TEXAS THIS WEEKEND AND WILL BRING WIDESPREAD PRECIPITATION. FOR MUCH OF THE

AREA...THIS PRECIPITATION WILL FALL AS RAIN. AREAS TO THE WEST AND
NORTH OF A LINE FROM GAINESVILLE..TO WEATHERFORD...TO
LAMPASAS...WILL SEE THE POTENTIAL FOR SNOWFALL ON SATURDAY.

TOTAL SNOWFALL ACCUMULATIONS ARE EXPECTED TO BE LESS THAN AN
INCH...WITH MOST ACCUMULATIONS OCCURRING ON GRASSY OR ELEVATED
SURFACES. TRAVEL IMPACTS WILL LIKELY BE LIMITED TO INTERSTATE
20...MAINLY WEST OF U.S. 287. BRIDGES AND OVERPASSES WILL BE THE
FIRST TO BECOME SLICK.

ELSEWHERE...RAIN COULD BECOME MIXED WITH SNOW DURING THE EVENING
HOURS ON SATURDAY. HOWEVER...SURFACE TEMPERATURES ARE EXPECTED TO
REMAIN ABOVE FREEZING...SO ACCUMULATIONS ARE NOT ANTICIPATED.

From: Mark Fox [mailto:mark.fox@...]
Sent: Friday, December 23, 2011 12:54 PM
To: Mark Fox
Subject: NWS Update: Holiday Weekend Outlook

Good afternoon everyone,

We still see the potential for accumulating snowfall across portions of north Texas. Whatever snow occurs, it should begin early tomorrow morning (Christmas Eve). There may be enough moisture to have a few showers or snow flurries linger into early Sunday, but the main impacts (if any) will affect north Texas on Saturday. Attached is a graphical description of the areas that have the potential for accumulating snowfall. The area is west of a line from Gainesville, to Weatherford, to Lampasas. This would include I-20, roughly west of mile marker 380. Areas to the south and east of this line will see a cold rain for much of the day on Saturday.

There will be the potential for a mixture of rain and snow during the evening hours on Christmas Eve in the I-35 corridor north of Hillsboro (This includes both I-35W and I-35). However, the overnight lows are expected to

be at or above freezing. The expectation is that any rain and snow mixture will melt as it hits the ground in the metroplex.

As of this afternoon, we believe there to be a 40-60% chance of snowfall late tonight and tomorrow.

Based on current trends and assuming it will snow (in the area described above):

40% probability of the areas in question seeing only flurries

40% probability of the areas in question seeing between ½☐ and 1☐

15% probability of the areas in question seeing between 1☐ and 1 ½☐

5% probability of the areas in question seeing between 1 ½☐ and 3☐

TIMING

The potential for accumulating snowfall will be on Saturday (Christmas Eve). Snow will between 6 AM and 9 AM Saturday, and linger through the early morning hours on Sunday. The most likely time for accumulating snowfall will be between 9 AM and 6 PM on Saturday.

UNCERTAINTY

There is more than the usual amount of uncertainty with this system. Our best confidence is to call for accumulating snowfall in the I-20 corridor between Weatherford and Cisco, with even higher probabilities of snowfall to the west of the Fort Worth area of responsibility (see WFO San Angelo or WFO Midland forecasts for details).

BOTTOM LINE

There is a likelihood of accumulating snowfall to the west of a line from Gainesville to Lampasas over the holiday weekend. There is a small chance of us issuing a winter weather advisory for our far northwestern and western counties.. Please closely monitor National Weather Service forecasts, graphics, outlooks and statements for the further refinement of areas that could be impacted. Also, closely monitor current weather and road conditions across the western half of the state for additional areas to be impacted.

5273. 147.300 repeater, Belton, Texas transfer to CTARC

Yahoo group: Temple_ARC
Date: 2012-01-05 03:35:50 UTC
From: Joe Dorn, W5VEX
Topic: 5273 Message: 5273

The 147.300 repeater is now under the trusteeship of the Central Texas Amateur Radio Club. The repeater is Bell County property and is located on a tower (about 100 feet up) on North Main Street in Belton behind the County Agent's building; it was used for county business until the trunked system was installed.

Jim Coleman, N5DJJ, requested the transfer about a month ago. Individuals may only transfer repeater rights to a club or the repeater frequency pair goes back into the available pool for re-coordination.

The call sign will be changed to W5AMK and the PL to 123. The PL is being changed to make it consistent with most of the other repeaters in the area.

THE REPEATER IS OPEN TO ALL AMATEUR RADIO OPERATORS FOR GENERAL USE AND SHOULD BE CONSIDERED A BACKUP REPEATER FOR EMERGENCY COMMUNICATIONS. We will probably add an open EchoLink connection to it. The repeater has pretty good coverage, exceeding the Bell County boundaries.

WHY W5AMK?

W5AMK was the call sign of Merrill Eidson, one of the founders of the Temple Amateur Radio Club and very influential in the Amateur Radio Community until his death in 1995 (my memory). This was about the time I was getting back into the ham business. When I was the TARC Emergency Coordinator, I suggested that TARC acquire his call for a second repeater installation but the suggestion was passed on.

Madene, his daughter, and I were classmates in Central Junior High and Temple High Schools (1947-1954). Her mother, Madie, W5DQF, was a room mother; both were or became hams. Merrill was an active 'Elmer' (a term not in place at the time) for the influx of young hams that occurred when the Novice License was introduced. At the time Merrill owned the Eidson Electronic Service on North 3rd (now Wear's) and had the Hallicrafter's dealership. I was the 3rd Novice in Temple and purchased an SX-71 from him on lay away, (I chose a radio(s) rather than a jalopy as my teen age pride and joy).

After returning to Hamdom In 1996, I purchased a lot of Merrill's equipment and have his last set up, a Kenwood HF rig, in my shop as I write. My SX-71 spent several years in Marion Hagler's possession in Lubbock. (Marion was another early local Novice and in my wife's High School class.) I believe he became head of the Electrical Engineering Department at Texas Tech. A year ago, just before Christmas, Marion called me and said he was returning my SX-71, the best Christmas gift I have ever received. The radio is now setting next to Merrill's rig. (I am afraid to turn it one for fear of blowing capacitors and tubes.)

As is obvious, I have a great appreciation for Merrill and the other 'Elmers' of the period that assisted a lot of young kids get started in amateur radio and thus started in electronic based careers.

When the Central Texas hospital system exceeded 15 locations, we had to acquire another club call for the packet id's (APRS). I went looking and W5AMK was still available; I contacted Madene and asked her approval to get the call for the Bell County Reservist group; she was very supportive. When The Central Texas Amateur Radio Club was formed W5AMK was transferred to CTARC. (the FCC frowns on clubs having too many calls)

We have since had to get another call, W5BEQ, as the network added more APRS locations. W5BEQ belonged to John Bloomer; a contemporary of Merrill's and a Belton ham. No repeater for John, YET! (Yes, I had a few hours with John also since we worked at Fort Hood Electronics Depot together during the Cuban Missile situation. (1962))

Sorting out the Club Calls:

W5LM is the TARC club call and initially belonged to Jess Coleman. It is used on the TARC repeater at Scott and White.

(Jess bought me my first bottle of wine on the way to a field day (1953).We won't talk about that any further.)

W5BEC is a Bell County Reservist club call and is used on the 147.14 repeater and non-hospital APRS locations. (It was never a local ham call)

W5BEQ is another Bell County Reservist club call, initially belonged to John Bloomer and is used on the first 15 hospital APRS locations.

W5AMK Is the CTARC club call, initially belonged to Merrill Eidson, and is used on the most recent hospital locations and now also the 147.30 repeater ID.

Ron Thompson W5WRE is the trustee for W5LM, I, W5VEX, am the trustee for the others.

Subject: Re: [SPAM] 147.300 belton, tx transfer to club

Gerald and Joe,

The transfer is completed and a login shall be sent to Joe for data management on this coordination.

PL change to 123.0 is also completed and the record is searchable to the public.

Thanks for the reminder as I just retrieved the envelope from a pile and missed Joe's note to confirm with him I had received it.

I get 20 lashes with a RG-142U jumper at Belton in April!

Thanks for coordinating with the TX VHF FM Society and 73,

Craig KV5E

As is obvious, I have a great appreciation for Merrill and the other 'Elmers' of the period that assisted a lot of young kids get started in amateur radio and thus started in electronic based careers.

When the Central Texas hospital system exceeded 15 locations, we had to acquire another club call for the packet id's (APRS). I went looking and W5AMK was still available; I contacted Madene and asked her approval to get the call for the Bell County Reservist group; she was very supportive. When The Central Texas Amateur Radio Club was formed W5AMK was transferred to CTARC. (the FCC frowns on clubs having too many calls)

We have since had to get another call, W5BEQ, as the network added more APRS locations. W5BEQ belonged to John Bloomer; a contemporary of Merrill's and a Belton ham. No repeater for John, YET! (Yes, I had a few hours with John also since we worked at Fort Hood Electronics Depot together during the Cuban Missile situation. (1962))

Sorting out the Club Calls:

W5LM is the TARC club call and initially belonged to Jess Coleman. It is used on the TARC repeater at Scott and White.

(Jess bought me my first bottle of wine on the way to a field day (1953).We won't talk about that any further.)

W5BEC is a Bell County Reservist club call and is used on the 147.14 repeater and non-hospital APRS locations. (It was never a local ham call)

W5BEQ is another Bell County Reservist club call, initially belonged to John Bloomer and is used on the first 15 hospital APRS locations.

W5AMK Is the CTARC club call, initially belonged to Merrill Eidson, and is used on the most recent hospital locations and now also the 147.30 repeater ID.

Ron Thompson W5WRE is the trustee for W5LM, I, W5VEX, am the trustee for the others.

Subject: Re: [SPAM] 147.300 belton, tx transfer to club

Gerald and Joe,

The transfer is completed and a login shall be sent to Joe for data management on this coordination.

PL change to 123.0 is also completed and the record is searchable to the public.

Thanks for the reminder as I just retrieved the envelope from a pile and missed Joe's note to confirm with him I had received it.

I get 20 lashes with a RG-142U jumper at Belton in April!

Thanks for coordinating with the TX VHF FM Society and 73,

Craig KV5E

Joe,

Some time ago, I gave Gerald RIchmond the two HAM Radios belonging to Robert that were in his car and mine, that HAMS use to "track' their vehicles. He was gong to put his call sign on them, and reinstall one in my car.

I emailed Gerald, but he hasn't gotten back to me. Do you know how to contact him?
I am involved with the Salvation Army now, and Cpt. Martha Higdon is a HAM. I want to give one of those radios to her so she can use it. She handles a lot of money for the Salvation Army, and carries it in her vehicle. She needs a way to be "monitored" during transport. If I can get one of the radios back, I'll let her have it.

Somebody is supposed to go see her and teach her how to use her HAM Radio.

I would also like for the ham antennae in my back yard to be taken down, but can't do it. It is leaning, and it needs to come down. I am going to get rid of the 2 HTs and the base radio Robert had. The HAM stuff is a painful thing for me to deal with.

Please let me know how you can help.

Thanks,
Eula Jett

Subject: [TARC] FW: 147.300 repeater, Belton, Texas transfer to CTARC

This might have been blocked as spam from

the reflectors so I am resending to them…

Joe B. Dorn, W5VEX

The 147.300 repeater is now under the trusteeship of the Central Texas

Amateur Radio Club. The repeater is Bell

County property and is

located on a tower (about 100 feet up) on North Main Street in Belton behind the

County Agent's building; it was used for county business until the trunked

system was installed.

Jim Coleman, N5DJJ, requested the transfer about a month ago.

Individuals may only transfer repeater rights to a club or the repeater frequency pair goes back into the available pool for re-coordination.

The call sign will be changed to W5AMK and the PL to 123. The PL is being changed to make it consistent with most of the other repeaters in the area.

THE REPEATER IS OPEN TO ALL AMATEUR RADIO OPERATORS FOR GENERAL USE AND SHOULD BE CONSIDERED A BACKUP REPEATER FOR EMERGENCY COMMUNICATIONS. We will probably add an open EchoLink connection to it. The repeater has pretty good coverage, exceeding the Bell

County boundaries.

WHY W5AMK?

W5AMK was the call sign of Merrill Eidson, one of the founders of the Temple Amateur Radio Club and very influential in the Amateur Radio Community until his death in 1995 (my memory). This was about the time I was getting back into the ham business. When I was the TARC Emergency Coordinator, I suggested that TARC acquire his call for a second repeater installation but the suggestion was passed on.

Madene, his daughter, and I were classmates in Central Junior High and Temple High Schools (1947-1954). Her mother, Madie, W5DQF,

was a room mother; both were or became hams. Merrill was an active ‘Elmer’ (a term not in place at the time) for the influx of young hams that occurred when the Novice License was introduced. At the time Merrill owned the Eidson Electronic Service on North 3rd (now Wear’s) and had the Hallicrafter’s dealership. I was the 3rd Novice in

Temple and

purchased an SX-71 from him on lay away, (I chose a radio(s) rather than a jalopy as my teen age pride and joy).

After returning to Hamdom In 1996, I purchased a lot of Merrill’s equipment and have his last set up, a Kenwood HF rig, in my shop as I write. My

SX-71 spent several years in Marion Hagler’s possession in Lubbock. (Marion was another early

local Novice and in my wife’s High School class.) I believe he became

head of the Electrical Engineering Department at Texas Tech. A year ago, just

before Christmas, Marion

called me and said he was returning my SX-71, the best Christmas gift I have

ever received. The radio is now setting next to Merrill’s rig. (I am

afraid to turn it one for fear of blowing capacitors and tubes.)

As is obvious, I have a great appreciation for Merrill and the other

‘Elmers’ of the period that assisted a lot of young kids get

started in amateur radio and thus started in electronic based careers.

When the Central Texas hospital system

exceeded 15 locations, we had to acquire another club call for the packet

id’s (APRS). I went looking and W5AMK was still available; I contacted

Madene and asked her approval to get the call for the Bell County Reservist

group; she was very supportive. When The Central Texas Amateur Radio Club was

formed W5AMK was transferred to CTARC. (the FCC frowns on clubs having too many

calls)

_____

From: Greg Patrick [mailto:gregory.patrick@...]
Sent: Monday, January 23, 2012 12:51 PM
To: undisclosed-recipients:
Subject: NWS Update: Heavy Rain potential Tuesday night

Good afternoon everyone,

Widespread rain is expected to develop across nearly all of north Texas Tuesday afternoon and continue into Thursday. The rainfall

will be welcome in most areas plagued by recent drought conditions, but we have some concerns that locally heavy rains will cause

at least some minor flooding issues. Widespread severe weather is not expected with this system, but an isolated severe thunderstorm

will be possible Tuesday night or early Wednesday morning.

OVERVIEW

A strong and slow-moving upper level system will move across extreme northern Mexico through Wednesday before lifting out across

Texas on Thursday. An unseasonably moist airmass will spread north from the Gulf of Mexico on Tuesday and lead to widespread

shower and thunderstorm activity by late Tuesday. A north-south oriented stationary front will develop across the eastern parts of north

Texas Tuesday night and focus very heavy rainfall into Wednesday morning. WIth so much moisture and widespread rain activity,

the instability needed for organized severe thunderstorms will likely not develop.

Most of north Texas will receive 1 to 2 inches of rainfall, but an axis of total rainfall amounts of 2 to 4 inches can be expected near the

stationary front. At this time, the heaviest rains and greatest potential for flooding is expected to occur in the Sulphur Springs, Canton,

Corsicana, Groesbeck, Palestine, and Athens areas. The heaviest rains are expected to remain just east of both the DFW and Waco

areas, but 1 to 2 inches of rain is still expected in the DFW and Waco areas.

IMPACTS

In areas where the heaviest rain occurs, localized flooding can be expected. Low-lying areas and county roads that typically flood

during heavy rain events will likely be impacted. In urban areas near and around Waco, Dallas, and Fort Worth, flooding of streets and

other poor drainage areas can be expected to cause at least a few issues. Based on current rainfall forecasts, only minor river flooding

is expected at isolated locations.

An isolated severe thunderstorm with hail up to the size of quarters and wind gusts around 60 mph will be possible around Waco, Athens,

Palestine, and Centerville late Tuesday night or early Wednesday morning.

TIMING

The potential for heavy rain will start after sunset Tuesday evening and continue until about noon on Wednesday. Some lighter rainfall

can be expected to continue through Thursday before skies begin to clear behind the system on Friday.

UNCERTAINTY

The exact location of the heaviest rainfall is uncertain, but generally we expect lighter rains to affect areas west and northwest of DFW

and heavier rains to affect areas east of I-35/I-35W.

BOTTOM LINE

Expect widespread rains of 1-2 inches to cause some flooding issues Tuesday night into Wednesday morning. The most likely impacts

at this time will be urban street flooding, flooding of low-lying areas near creeks and streams, and flooding in poor drainage areas.

Closely monitor National Weather Service forecasts, graphics, outlooks and statements for the latest predictions of rainfall amounts and

potential impacts.

Subject: [TARC] Fund benefit for local family in Troy, TX

I am putting a copy of a benefit flier on the files section that I saw today in our office where I work. The grandmother works in the same office down the hall from me.

There will be a chicken dinner and silent auction fundraiser for the Olveda f amily on Sunday Feb 12th 11:00 - 2:00PM at Troy United Methodist Church (the old Troy middle school). Tickets are $8 and a fund at Extraco Bank (Benefit Account for Sayleigh Olveda) if anyone is interested in helping them out. The daughter has Spinal Muscular Atrophy.

This message will be removed by me in a week or so.

THANKS

Mike Hankins, Ki5M

5292. FW: [WCARC] Central US Shakeout

Yahoo group: Temple_ARC
Date: 2012-02-04 16:26:55 UTC
From: Joe Dorn, W5VEX
Topic: 5292 Message: 5292

BCC: My Lists and others.

This is a simulated earthquake drill and Texas is relatively safe from this type of event, however our adjacent states to the north are not and if there was a major infrastructure hit we would probably become involved. More details at:

http://www.shakeout.org/centralus/

This is an excellent opportunity for those of us that are available to do a little EC HF work. I am going to set up my rig to monitor 7260 until after the event if anyone wishes to check out the frequency. Beware! I am not around the radio most of the time since it is in my unheated shop.

The timing of the event is for the 8 to 5 folks so amateur radio participation might be a little low.

Joe B. Dorn, W5VEX

Sent: Saturday, February 04, 2012 9:05 AM
To: WCARC@yahoogroups.com
Subject: [WCARC] Central US Shakeout

The Central US Shakeout Drill will have a net on Tuesday, Feb 7 at 10:15 A.M. Here is the information from Mark Conklin in Oklahoma.

I have asked about holding a separate net for Texas and reporting totals, however the organizers have requested individual check-ins. If you can be available during the test, please check in.

I have registered STX ARES as a participant in the drill.

On February 7, 2012, beginning at 10:15 a.m.* CST Amateur Radio Emergency Service-Oklahoma will be calling a radio HF net on 7260 kHz a in participation with the 2012 Great Central U.S. ShakeOut!

More than one million people across nine states will participate in the 2012 Great Central U.S. ShakeOut!

During this drill "Drop, Cover and Hold On" - Drop to the ground, take Cover under a table or desk, and Hold On to it as if a major earthquake were happening (stay down for at least 60 seconds). Practice now so you will immediately protect yourself during earthquakes

Then, get up, dust off and ALL radio amateurs in Oklahoma, Arkansas, Missouri, Illinois, Indiana, Kentucky, Tennesse, Mississippi & Alabama are requested to check in to the HF net on 7260 kHz and participate with ARES.

Following the KISS principal this net will be a CHECK IN ONLY net only. Check in with your call sign and location. No traffic will be handled by this net. The net will open at 10:15 a.m.* CST on 7260 kHz and run no more than one hour.

The Net Control Stations will be Joe N5TEX and Jack KB5KKT.

SEC's for all Sections are invited to register your section at

<http://www.shakeout.org/centralus/communication/>
http://www.shakeout.org/centralus/communication/

And/also please share this NET announcement with all in your sections.

5298. Bell County 2012 SkyWarn Session

Yahoo group: Temple_ARC
Date: 2012-02-13 17:22:31 UTC
From: Joe Dorn, W5VEX
Topic: 5298 Message: 5298

Mark.

I would like to go on record as saying that the Bell County SkyWarn session just completed was the best one for the target audience that I have attended since my first one in 1996.

The material was presented in a fashion that was understandable by most newcomers to the weather scene and in an interesting fashion. This is evidenced by the number of people that remained for the entire morning session and then returned for the afternoon session. The morning session was attended by over one hundred people; the best attendance we have had in several years. I was really impressed by the number of people still in attendance at five o'clock. My estimate was fifty plus.

Jason's radar presentation was great as usual and we always learn something new. I have to apologize but I don't remember the name of the last presenter; he gave what was far and away the best presentation on spotter/chaser location relative to the storm that I have ever seen PERIOD!!!

The clip on the operations was eye-opening and serves to keep us, the net controllers, more aware of the other end. It is very easy to lapse in to casual conversation during lulls in the action especially on our wide coverage machine where we might be active for ALMOST as long as the FTW hams. I try to remain aware of the chit-chat but still must plead guilty to a lot of what was displayed.

Thanks for the fine effort you and the Fort Worth staff did on this session.

Subject: [TARC] Membership expires if not paid by the end of February !

This message is going to EVERYONE who is registered on the YAHOO group of Temple_ARC. If you already paid, many thanks !

There are a few people who have not paid the membership dues yet.
Some of those no longer attend the meetings, and also were not at the Christmas party. If you stop receiving the US Postal bulletin you may need to check if your membership is paid for 2012 !

There are a few who asked about dues at the Christmas dinner, and I said wait until the club meeting to pay dues. It is only a couple of people. Most of those paid a the last meeting.

I will not publish a list of those not paid, except to the board members. Feel free to ask me if you are not sure.

Those who wish to remain members may pay by check to our PO Box 616 Temple, TX address, or PayPal from the TARC.ORG web site or pay me on March 1st at the club meeting.

Everyone please come to the TARC meeting the first Thursday of March.
That's right, March 1st. We will vote on a change to the By-Laws, concerning "Family Membership".

To: undisclosed-recipients:
Subject: NWS Update: Strong Winds Today/Severe Weather and Heavy Rainfall Thursday through Sunday

Good morning,

An active period of weather is in store for North Texas for the remainder of the week. Strong south winds today will average 20 to 30 mph with gusts to around 40 mph this afternoon. The strong winds will transport abundant gulf moisture northward and set the stage for a round of severe thunderstorms Thursday and a prolonged period of rain that will continue through Sunday. The potential exists for two to four inches of rain over a large area with some locations receiving in excess of 5 inches. This will result in a threat of flooding in urban areas and of rivers, streams and creeks. There remains some uncertainty in exactly how this weather event will unfold, but all indications are for a significant round of thunderstorms and heavy rainfall.

Overview...A cold front well to our north will drop southward and into North Texas Thursday as a strong upper level storm system approaches from the west later in the week. Showers will be scattered across the area beginning Wednesday, but the threat of severe weather will exist from early Thursday afternoon through the evening across all of North Texas. At this time, large hail and damaging winds will be the primary threats, although isolated tornadoes cannot be ruled out. The cold front will move through North Texas by Friday morning before stalling just to our south, ushering in cooler air but also setting the stage for a prolonged rain event Friday through Sunday.

Timing/Impacts: The threat of severe thunderstorms will exist beginning early Thursday afternoon along and north of Interstate 20, with storms tending to develop farther south with time toward Waco, Temple, Killeen and surrounding areas by late afternoon or evening. Spotter activation will be likely as the storms will pose a threat of large hail, damaging winds and isolated tornadoes. After the front stalls, moisture will override the cooler air near the surface resulting in a prolonged period of rain and thunderstorms Friday into Sunday, with much of North Texas receiving two to four inches of rain. Some locations along and east of Interstate 35 may see in excess of five inches by Sunday. This will result in rises on rivers, streams and creeks and in urban areas resulting in the potential for flooding.

Uncertainty...Confidence is relatively high on the threat of severe thunderstorms Thursday and on heavy rainfall Friday through the weekend. The usual uncertainties exist on the exact locations where the heaviest rain will fall and on the final amounts. Our web page will contain our latest thinking as trends evolve and new data are received.

Bottom Line...Spotter groups should be prepared for activation due to the potential for severe weather Thursday afternoon and evening. A

flood Watch will likely be issued for portions of North Texas in the next day or so as the flood threat becomes more clearly defined. There is some potential for significant river flooding in some areas, so monitor later forecasts on total rainfall amounts and locations.

One last note...I will be leaving my current position and the NWS Office here in Fort Worth to become the Operations Branch Chief at the Storm Prediction Center in early April. My last day here will be Friday, April 6th. I wanted to express my thanks to everyone for making the ten years I've been here so enjoyable, and for what we have accomplished together. My email address will not change and I hope to keep in touch after I leave.

Here are some important web links. If you need additional information or support, please don't hesitate to give us a call.

Subject: [WC-ARES] Solar storm headed toward Earth may disrupt power

Updated 4:04 PM ET

(CBS/AP) WASHINGTON - The largest solar storm in five years is racing toward Earth, threatening to unleash a torrent of charged particles that could disrupt power grids, GPS and airplane flights.

The sun erupted Tuesday evening, and the effects should start smacking Earth between 1 a.m. and 5 a.m. EST Thursday, according to forecasters at the federal government's Space Weather Prediction Center. They say the storm, which started with a massive solar flare, is growing as it speeds outward from the sun.

"It's hitting us right in the nose," said Joe Kunches, a scientist for the National Oceanic and Atmospheric Administration. He called it the sun's version of "Super Tuesday."

Scientists say the sun has been relatively quiet for some time. And this storm, while strong, may seem fiercer because Earth has been lulled by several years of weak solar activity.

"This is a good-size event, but not the extreme type," said Bill Murtagh, program coordinator for the space weather center.

The solar storm is likely to last through Friday morning, but the region that erupted can still send more blasts our way, Kunches said. He said another set of active sunspots is ready to aim at Earth right after this.

But for now, scientists are waiting to see what happens Thursday when the charged particles hit Earth at 4 million mph.

From: Greg Patrick [mailto:gregory.patrick@...]
Sent: Friday, March 16, 2012 2:34 PM
To: undisclosed-recipients:
Subject: NWS Update: Significant Weather Event on March 19

Good afternoon,

The dry, but unseasonably warm and humid, weather we've had over the past week will be

coming to an end by Monday. The potential impacts are several days away, but we wanted

to get a message out before the weekend.

OVERVIEW

A very strong and slow-moving upper level system will develop over the western U.S. this

weekend and then move across the southern Rockies early next week. A cold front associated

with this system will move slowly from west to east across north and central Texas on Monday

and Tuesday.

The weather pattern we are expecting early next week is sometimes associated with a round of

strong to severe storms, followed by several rounds of locally heavy rainfall. That pattern is

characterized by upper level winds blowing from south to north in a direction nearly parallel to

the slow-moving frontal boundary. When this happens, numerous showers and thunderstorms

develop in the vicinity of the front and move north. The progression of the heavy rains is related

directly to the eastward progression of the front, which is expected to be very slow in this case.

IMPACTS

Scattered severe thunderstorms, with a potential to produce large hail, damaging downburst winds,

and isolated tornadoes, may affect north and central Texas on Monday and Monday night. More

widespread impacts are expected to be related to flooding associated with very heavy rainfall

Monday into Tuesday. Our event-total rainfall forecasts indicate that widespread 1-3 inch

rains are expected...with local amounts over 4 inches possible. Flash flooding in urban areas

and along creeks and streams will be possible Monday into Tuesday.

Hydrologists at the West Gulf River Forecast Center are monitoring the potential for significant

flooding on headwaters and tributaries in the upper Sabine and upper Trinity River basins.

TIMING

An isolated severe storm will be possible tonight into Saturday morning, and again Sunday

afternoon and Sunday evening. However, the primary event and most widespread impacts are

expected to begin Monday morning with scattered severe thunderstorms possible Monday into

Monday night.

The primary flash flood threat will be Monday into early Tuesday. Any significant river flooding

that occurs from the heavy rains would occur Tuesday into Wednesday.

UNCERTAINTIES AND ADDITIONAL SCENARIOS

The primary uncertainty with this system is the timing and potential for severe thunderstorms.

The greatest potential for severe weather appears to be early in the event on Monday as initial

thunderstorm development occurs in the unstable airmass near the cold front. With time, the

threat will gradually evolve into flooding from heavy rainfall as numerous showers and thunderstorms

advance only very slowly eastward across the area.

If individual thunderstorms can develop well east of the cold front on Monday, the severe

weather threat for damaging winds and tornadoes would be enhanced. If the frontal boundary

stalls across the area, even for a 6 hour period, then the threat for flooding rains will be maximized

in the area near the stalled front. If the front does stall across north and central Texas, the most

likely location would be from Paris to Athens to Hearne.

BOTTOM LINE

Monitor our web page for the latest forecasts on timing of severe weather and flooding potential early

next week. Flood Watches or Flash Flood Watches could be posted as early as Sunday if conditions

still appear favorable for widespread heavy rains.

Subject: NWS Update: Significant Weather Event on March 19

Good afternoon,

The dry, but unseasonably warm and humid, weather we've had over the past week will be

coming to an end by Monday. The potential impacts are several days away, but we wanted

to get a message out before the weekend.

OVERVIEW

A very strong and slow-moving upper level system will develop over the western U.S. this

weekend and then move across the southern Rockies early next week. A cold front associated

with this system will move slowly from west to east across north and central Texas on Monday

and Tuesday.

The weather pattern we are expecting early next week is sometimes associated with a round of

strong to severe storms, followed by several rounds of locally heavy rainfall. That pattern is

characterized by upper level winds blowing from south to north in a direction nearly parallel to

the slow-moving frontal boundary. When this happens, numerous showers and thunderstorms

develop in the vicinity of the front and move north. The progression of the heavy rains is related

directly to the eastward progression of the front, which is expected to be very slow in this case.

IMPACTS

Scattered severe thunderstorms, with a potential to produce large hail, damaging downburst winds,

and isolated tornadoes, may affect north and central Texas on Monday and Monday night. More

widespread impacts are expected to be related to flooding associated with very heavy rainfall

Monday into Tuesday. Our event-total rainfall forecasts indicate that widespread 1-3 inch

rains are expected...with local amounts over 4 inches possible. Flash flooding in urban areas

and along creeks and streams will be possible Monday into Tuesday.

Hydrologists at the West Gulf River Forecast Center are monitoring the potential for significant

flooding on headwaters and tributaries in the upper Sabine and upper Trinity River basins.

TIMING

An isolated severe storm will be possible tonight into Saturday morning, and again Sunday

afternoon and Sunday evening. However, the primary event and most widespread impacts are

expected to begin Monday morning with scattered severe thunderstorms possible Monday into

Monday night.

The primary flash flood threat will be Monday into early Tuesday. Any significant river flooding

that occurs from the heavy rains would occur Tuesday into Wednesday.

UNCERTAINTIES AND ADDITIONAL SCENARIOS

The primary uncertainty with this system is the timing and potential for severe thunderstorms.

The greatest potential for severe weather appears to be early in the event on Monday as initial

thunderstorm development occurs in the unstable airmass near the cold front. With time, the

threat will gradually evolve into flooding from heavy rainfall as numerous showers and thunderstorms

advance only very slowly eastward across the area.

If individual thunderstorms can develop well east of the cold front on Monday, the severe

weather threat for damaging winds and tornadoes would be enhanced. If the frontal boundary

stalls across the area, even for a 6 hour period, then the threat for flooding rains will be maximized

in the area near the stalled front. If the front does stall across north and central Texas, the most

likely location would be from Paris to Athens to Hearne.

BOTTOM LINE

Monitor our web page for the latest forecasts on timing of severe weather and flooding potential early

next week. Flood Watches or Flash Flood Watches could be posted as early as Sunday if conditions

still appear favorable for widespread heavy rains.

Cell Phone:(254) 721-0829

From: Mark Fox [mailto:mark.fox@...]
Sent: Sunday, March 18, 2012 10:57 AM
To: undisclosed-recipients:
Subject: NWS UPDATE: Early Week Severe Weather / Heavy Rainfall Potential

Good morning,

The forecast is still on track for a severe weather and heavy rain event across North and Central Texas Monday through Tuesday. The best window for severe weather looks to be Monday afternoon and Monday night. The best window for heavy rainfall that may result in flash flooding looks to be Monday night into Tuesday morning over mainly the eastern half of North Texas. A Flash Flood Watch may be issued for parts of North and Central Texas later today. The most likely location for this watch would be along and/or east of the I-35/35E corridor.

OVERVIEW

A very strong and slow-moving upper level system currently over the west coast will continuing moving east over the next 72 hours. A dryline/cold front will remain west of the region on Monday but will finally enter the region Monday night and slowly progress east through the day on Tuesday. This weather pattern is sometimes associated with one or more rounds of strong to severe storms, followed by additional rounds of locally heavy rainfall. The pattern is characterized by upper level winds blowing from south to north in a direction nearly parallel to the slow-moving frontal

boundary. When this happens, numerous showers and thunderstorms develop in the vicinity of the front and move north. With the slow eastward progression of the front, oftentimes in these cases showers and thunderstorms continue to move over the same areas resulting in heavy rainfall and flash flooding.

IMPACTS

Scattered severe thunderstorms, with a potential to produce large hail, damaging downburst winds and isolated tornadoes, may affect North and Central Texas on Monday and Monday night. If the system slows down or stalls, parts of the area, mainly east of Interstate 35/35E could continue to experience severe weather on Tuesday. Additional impacts are expected to be related to flooding associated with very heavy rainfall Monday into Tuesday. Our event-total rainfall forecasts indicate that widespread 3-5 inches (and isolated pockets of 6+ inches) of rain is possible along and east of the I-35/35E corridor with widespread 1-3 inches elsewhere. Flash flooding in rural and urban areas and along creeks and streams will be possible Monday into Tuesday. Hydrologists at the West Gulf River Forecast Center are monitoring the potential for significant flooding on headwaters and tributaries.

TIMING

There is a low threat for isolated severe storms today (Sunday) and tonight, but the severe weather threat will increase on Monday. On Monday morning, elevated thunderstorms may produce hail and/or damaging winds. The severe weather threat will be the highest Monday afternoon through Monday night when scattered severe storms or a squall line may develop along the dryline west of the region and then advance east into North Texas. It is also possible that discrete supercells may also develop ahead of the dryline in North and Central Texas on Monday afternoon. As the dryline/front moves into North and Central Texas Monday night and Tuesday, the threat for severe storms will continue with possibly another round of severe storms developing during the day on Tuesday. The primary flash flood threat will be Monday night into Tuesday. Any significant river flooding that occurs from the heavy rains would occur Tuesday into Wednesday.

UNCERTAINTIES AND ADDITIONAL SCENARIOS

While we are confident that severe weather and heavy rainfall will affect North and Central Texas Monday through Tuesday, there are uncertainties in how the overall evolution of the event will unfold (i.e. will we get one solid line of storms moving through the region or will we get several rounds of potentially severe weather?). There is increasing confidence that a line of storms or a squall line will impact the region at some point, but there are timing uncertainties of when this will occur (it could be Monday evening and night or Tuesday morning instead). Another possibility is that the upper level system slows down a bit delaying the significant impacts into Tuesday.

BOTTOM LINE

Emergency Management, elected and public safety officials should be aware of the potential for a prolonged period of active springtime weather. Severe weather and heavy rainfall is expected across most of North and Central Texas Monday through Tuesday. Continue to closely monitor National Weather Service forecasts, updates, and graphics for the latest information on timing of severe weather and flooding potential. Severe weather watches and warnings may begin as early as Monday morning but are more likely Monday afternoon into Tuesday. A Flash Flood Watch will likely be hoisted for portions of Northern and Central Texas later today for areas along and /or east of the I-35/35E corridor.

5316. FW: The ARRL Letter for March 22, 2012

Yahoo group: Temple_ARC
Date: 2012-03-23 15:06:16 UTC
From: Joe Dorn, W5VEX
Topic: 5316 Message: 5316

The current ARRL Letter has information about the National Hurricane Conference starting Monday in Orlando with three sessions of special interest to amateur radio operators. The bad news is that none of us will be attending probably; the good news is that live streaming is going to be available.

If you can not read the letter copied below then go to:

http://www.arrl.org/arrlletter?issue=2012-03-22

The first session of interest will be Monday at 12:30 PM CENTRAL Time.

NHC Session #1: Amateur Radio Training Sessions: Disaster Communications Before, During and After Hurricanes is scheduled for Monday, March 26 from 1:30-5:00 PM.

The second session of interest will be Tuesday morning at 7:30 AM CENTRAL Time.

NHC Session #2: Amateur Radio Rap Session -- The Emergency Manager's Hidden Resource is designed for Emergency Management Agencies. It is scheduled for Tuesday, March 27 from 8:30-10:00 AM

The third session of interest will be Monday evening at 6:00 PM CENTRAL Time.

On Monday, March 26 from 7-9 PM, the Orange County Communications Auxiliary, the Orange County Emergency Operations Center and the ARRL Southeastern Division will host an interactive NHC Workshop. This workshop is geared for all ARES members and interested radio amateurs.

Streaming will be at:

http://www.voipwx.net/files/stream.htm

and

http://www.nsradio.org/stream.htm

+ New ARRL Membership Benefits Coming in June

<http://www3.arrl.org/nl/al/image/DigitalQST_logo.jpg>

Beginning in June, ARRL members will have access to a digital edition of QST
that can be read on smartphones, tablets and computers.

The ARRL is excited to announce two new membership benefits that will be
introduced in June 2012. In addition to the print copy of QST, all members
will have access to an online digital edition of QST -- at no extra cost.
You will be able to access QST from anywhere -- on nearly any computer,
laptop, mobile device, smartphone and tablet (including Apple iPad, iPhone,
iTouch and devices using the Android operating system). Members will also
gain access to archived issues of QST from December 1915 to the present;
previously, only issues through 2007 were available to members. If you are
familiar with the current periodicals archive, that platform will be
expanded to include all of QST from December 1915 through December 2011. A

second, new archive will be introduced for issues beginning January 2012, featuring enhanced functionality including full-text search. Read more here <http://www.arrl.org/news/coming-soon-new-arrl-membership-benefits> .

+ ARRL Announces New DXCC Fee Structure

<http://www3.arrl.org/nl/al/image/DXCC_logo.jpg>

The DX Century Club (DXCC) is the premier Amateur Radio operating award. Available to hams around the world, tens of thousands of awards have been issued since 1945 under the modern award program. In 2012, the DXCC program is not only still thriving, but it is growing, both in participation and in numbers of award options. The addition of Logbook of the World and soon, the addition of an Online DXCC Application utility, will continue to help the program grow. Effective Monday, April 2, the way DXCC fees are assessed will change. These changes will include both rate increases and rate decreases. Read more here <http://www.arrl.org/news/arrl-announces-new-dxcc-fee-structure> .

+ Executive Committee to Meet this Weekend in Missouri

<http://www3.arrl.org/nl/al/image/ARRL_Flag_wavy_large.JPG>

The ARRL Executive Committee will meet Saturday, March 24 in St Louis, Missouri. Agenda items include a review of the ARRL policy on repeater coordination, a look at how the mandated study on Amateur Radio -- as outlined in Section 6414 in the just-passed payroll tax legislation -- will be implemented, the first periodic review of the National Broadband Plan Committee report, discussion of the proposed changes to the FCC's rules as set forth in report from the ARRL Electromagnetic Compatibility Committee and more . ARRL President Kay Craigie, N3KN, serves as chairman of the Executive Committee. Click here <http://www.arrl.org/news/executive-committee-to-meet-this-weekend-in-missouri> for more information, including a link to the meeting's agenda.

Solar Update

<http://www3.arrl.org/nl/al/image/latest032212.jpg>

The Sun, as seen on Thursday, March 22, 2012 from NASA's SOHO Extreme Ultraviolet Imaging Telescope <http://sohowww.nascom.nasa.gov/data/realtime/realtime-update.html> . This image was taken at 304 Angstrom; the bright material is at 60,000 to 80,000 Kelvin.

Tad "The Sun has long been <http://www.poets.org/viewmedia.php/prmMID/21699> set" Cook, K7RA, reports: Solar activity declined this week - the average daily sunspot numbers were off by more than 13 points to 75.1, while the average daily solar flux dropped more than 32 points to 102.1. Solar flux values have also dropped below 100 for the past two days; they are expected to remain there until March 28. The next short-term peak in solar flux is expected at the 135 level for April 3-6. The predicted solar flux for March 22 is 95. On March 23-26, expect 90, then 95, 100 and 100 on March 27-29, 130 on March 30-April 2, then 135 on April 3-6, and 130, 120, 115 and 105 on April 7-10, and 100 on April 11-15. The predicted planetary A index is 7 on March 22, 5 on March 23-27, 10 on March 28, 8 on March 29-31, 5 on April 1-2, 8 on April 3-4, 5 on April 5-9, then 12, 5, 5, 15 and 10 on April 10-14, and 5 again on April 15-23. Look for more information on the ARRL website on Friday, March 23. For more information concerning radio propagation, visit the ARRL Technical <http://www.arrl.org/propagation-of-rf-signals> Information Service Propagation page. This week's "Tad Cookism" is brought to you by William Wordsworth's The Sun Has Long Been <http://www.poets.org/viewmedia.php/prmMID/21699> Set.

+ TAPR Opens "Interest List" for Hermes SDR

<http://www3.arrl.org/nl/al/image/TAPR.jpg>

Tucson Amateur Packet Radio (TAPR) announces the opening of the "interest list" for the openHPSDR Hermes single-board Software Defined Radio. The Hermes interest list is used by TAPR to determine the number of Hermes boards to manufacture in the pending initial production run this spring. Hermes is a long-awaited addition to the openHPSDR project lineup, advancing

through four prototypes while evolving from a USB-based to an Ethernet-based transceiver in about two years. Hermes is a Direct-Down-Conversion receiver, a Direct-Up-Conversion 500 mW transmitter and a gigabit Ethernet interface all on one board. Also on board is an RF-quiet switch-mode power supply, which allows Hermes to run from a single 13.8 V dc source. Read more here <http://www.arrl.org/news/tapr-opens-interest-list-for-hermes-sdr> .

This Week in Radiosport

This week:

* March 24-25 -- CQ WW WPX Contest (SSB)
* March 26 -- QRP Homebrewer Sprint
* March 28 -- SKCC Sprint
* March 28-29 -- CWops Mini-CWT Test

Next week:

* March 31-April 1 -- Missouri QSO Party
* April 1 -- UBA Spring Contest (SSB)
* April 3 -- ARS Spartan Sprint

All dates, unless otherwise stated, are UTC. See the ARRL Contest <http://www.arrl.org/contests> Branch page, the ARRL <http://www.arrl.org/The-ARRL-Contest-Update> Contest Update and the WA7BNM Contest <http://www.hornucopia.com/contestcal/index.html> Calendar for more information. Looking for a Special Event station? Be sure to check out the ARRL <http://www.arrl.org/special-event-stations> Special Event Stations Web page.

Upcoming ARRL Section, State and Division Conventions and Events

* March 23-24 -- ARRL Maine <http://www.arrl.org/hamfests/maine-state-convention-2> State Convention, Lewiston, Maine

5318. FW: Spotter Network - Important Changes in 2012

Yahoo group: Temple_ARC
Date: 2012-03-31 16:37:49 UTC
From: Joe Dorn, W5VEX
Topic: 5318 Message: 5318

BCC: SKYWARN List

For those of you that have APRS trackers or other interfaces into the Spotter Network, the information below is a significant notice.

The FREE weather course on the spotter network site is VERY good and worth any weather nut's time. Its original purpose was to provide a minimum level of education to those spotters making reports to the weather service and other agencies in order to maintain creditability of the Spotter Network.

The network has grown beyond expectations due the Reid Timmer want-to-be's and the Discovery Channel's Storm Chaser series. The number of chasers has become a major traffic hazard in already dangerous storm front locations. (One benefit of high gasoline prices is the reduction of this hazard.) We, in south central Texas, are also somewhat removed from the base location of the majority of the chasers and don't have the 'Chaser convergence' that North Texas and Oklahoma has.

Currently there are so many chaser locations showing up on major events that you can not see the radar image on GRLx until you kill the SN input. The new requirement might decrease that clutter.

Meanwhile back in the world of the 'spotters', we still need your locations showing up on APRS and the SN. I subscribe to the AllisonHouse GRLx add-ons and one feature is that I can track ANY APRS spotter I enter into my configuration list and thus separate our locals from the chaser clutter.

Stated another way, I can track any spotter that makes it into the APRS network whither they take the training or not.

There are APRS App's that allow you to hit the network via 'pads' and smart phones. I encourage those of you that get out of the range of the APRS RF digipeaters to consider adding this facility.)

I encourage all of our spotters to take the course if you have not done so already.

I also suggest that you blow the dust out of your trackers since we have had very few events of interest over the past three years. You can verify with me if you are making the network, SN and/or APRS via the 147.14 repeater.

Subject: Spotter Network - Important Changes in 2012

Change in Testing requirement. Change in Terms of Use. Introduction of the ACES program.

Is this email not displaying correctly?

<http://us1.campaign-archive1.com/?u=3a4c535548ddf3f1867cc8373&id=56cdbb20ec&e=f268c39d1a> View it in your browser.

<http://spotternetwork.us1.list-manage.com/track/click?u=3a4c535548ddf3f1867cc8373&id=7c1e8074c2&e=f268c39d1a> Spotter Network Inc (NFP)

Change in Training Policy

Effective April 1, 2012 the Spotter Network will be implementing a <http://spotternetwork.us1.list-manage1.com/track/click?u=3a4c535548ddf3f1867cc8373&id=ff716ed6cf&e=f268c39d1a> mandatory training and testing requirement for participation. Historically, the training requirement was only required for those members who wished to submit storm reports through the SN system. All members were allowed to beacon their position on SN maps with or without meeting the training requirement. This, however, will no longer be permitted. Both the <http://spotternetwork.us1.list-manage1.com/track/click?u=3a4c535548ddf3f1867cc8373&id=d801dd27b4&e=f268c39d1a> Board of Directors and the Advisory Committee have unanimously agreed to this change and requested that the implementation be expedited for the 2012 severe weather season.

For those members who have already taken the training and testing, you will not need to take any further actions.

Changes in Terms of Use

The SN has recently updated its <http://spotternetwork.us1.list-manage1.com/track/click?u=3a4c535548ddf3f1867cc8373&id=ac7ad4ffbe&e=f268c39d1a> Terms of Use and wanted to make you aware of the changes as they relate to you. The SN believes these changes are in alignment with what our members would want and are directly due to the privacy concerns some members have expressed in the past.

1. No individual, company or organization may retain position information for more than 48 hours past the event without explicit approval of the SN.

2. No individual, company or organization may distribute a derivative work based on the position information after the 48 hours have expired without explicit approval of the SN.

Remember ACES

The Board of Directors and Advisory Committee want to urge all SN members to operate with safety as your number one priority when spotting or chasing in 2012. The SN training and safety groups within the Advisory Committee have developed the ACES Storm Spotter and Chaser program to make it easy to remember some basic safety rules this season. This program is being rolled out by both SN and SKYWARNT nationwide in 2012. ACES

1. Awareness - Maintain situational awareness at all times

2. Communication - Have multiple methods of communication and make sure someone else knows where you are

3. Escape Routes - Have planned escape routes in case the situation deteriorates or deviates from what you expected

4. Safe Zones - Identify safety zones so you don't become a victim. Don't become a part of the problem.

<http://gallery.mailchimp.com/3a4c535548ddf3f1867cc8373/images/SN_ACES.jpg>

Please support our sponsors...

Lastly, the Board of Directors would like to extend a full hearted "Thank you!" to our corporate sponsors including our premier partners <http://spotternetwork.us1.list-manage1.com/track/click?u=3a4c535548ddf3f1867cc8373&id=775f8b63fb&e=f268c39d1a> WeatherTAP and <http://spotternetwork.us1.list-manage1.com/track/click?u=3a4c535548ddf3f1867cc8373&id=4f9e01fe1c&e=f268c39d1a> AllisonHouse for their continuing financial contributions. ithout their generosity, much of what we do would not be possible. As you may or may not know, SN is a not-for-profit and run soley through the time and effort of our volunteers. If you or a company you know would like to support the 23,000 strong and growing SN membership, please encourage them to <http://spotternetwork.us1.list-manage1.com/track/click?u=3a4c535548ddf3f1867cc8373&id=264791e943&e=f268c39d1a> donate or become a partner. SN members provide an invaluable service to communities large and small during severe weather through position and storm reporting.

Stay Safe,

Tyler Allison

5319. VE's Needed for the Spring Ham Expo

Yahoo group: Temple_ARC
Date: 2012-03-31 18:53:26 UTC
From: Joe Dorn, W5VEX
Topic: 5319 Message: 5319

BCC: VE List

It is springtime and time for another Ham Expo and VE Test session on the 14th of April.

The testing situation is a little different this time. The test session will begin at 09:30 in the Main (domed) building on the second floor of the EXPO grounds. This change is at the request of the Temple Amateur Radio Club so that people that pass the exam will have a chance to purchase a radio and/or other gear.

I will need the VE's to assemble at 09:00 for setup and assignment.

I will release the VE's as quickly as possible as they are no longer needed so that they can have a chance to visit the main hall. The doors open at 07:00 for the general public but VE's should be able to get in earlier.

VE's assisting in the testing get in free by showing their VE badge and also will be invited to the 'post EXPO' breakfast. TARC might appreciate some assistance from you if you wish to help. They are looking for additional help in setting up on Friday afternoon also.

Please let me know if you will be assisting in the test session.

NOTE TO TARC: People who are coming to the test session ONLY may NOT be charged admission fees to the EXPO. If they wish to visit the EXPO they may be charged. This is an ARRL VEC requirement.

From: Greg Patrick [mailto:gregory.patrick@...]
Sent: Monday, April 02, 2012 11:19 AM
To: undisclosed-recipients:
Subject: NWS Update: Severe Weather Potential through Tuesday

Good morning,

One or more rounds of severe thunderstorms will likely affect parts of north and central Texas later this

afternoon into Tuesday. The first weather system, currently moving northeast from southeast Texas

into Louisiana, could affect areas near Palestine, Canton, and Paris late this afternoon. The second,

and more powerful upper system, was over New Mexico this morning will move into west Texas tonight

and then across OK and the rest of Texas Tuesday night. The atmosphere across north and central

Texas is very moist and will become very unstable by this afternoon.

OVERVIEW and TIMING

Most of the thunderstorm activity associated with the system in southeast Texas is expected to remain

across east Texas and Louisiana. However, an isolated severe thunderstorm will be possible this

afternoon across the far eastern areas of north Texas including Palestine, Canton and Paris. Any

storms in this part of north Texas will diminish or move out of the area by sunset today.

A dryline will become stationary from western OK into west TX this afternoon, and is expected to remain

just west of Young, Stephens, and Eastland Counties through tonight. However, scattered strong to severe

thunderstorms are expected to develop along the dryline late this afternoon and move east and northeast

toward north Texas. Some of these storms will likely remain severe as they affect areas mainly west of a

line from Sherman to Fort Worth to Goldthwaite this evening and tonight.

On Tuesday morning, there may be ongoing strong thunderstorm activity across north and central Texas,

especially west of Interstate 35/35E. By Tuesday afternoon, the dryline is expected to begin moving across the

area and will be a focus for more widespread thunderstorms. The morning shower and thunderstorm activity

is expected to diminish late in the morning, with some breaks in the cloud cover expected by midday. The

atmosphere may again become very unstable and lead to severe thunderstorm organization along the

dryline. A squall line may organize and track eastward across most of north and central Texas Tuesday

afternoon and Tuesday night. The thunderstorm potential will end before sunrise Wednesday morning.

IMPACTS

The degree of instability suggests that any storms that affect north and central Texas through tonight will

have a potential to produce very large hail up to baseball size. In addition, damaging downburst winds and

an isolated tornado will also be possible this evening and tonight. On Tuesday, large hail up to golfball size

and damaging downburst winds will be possible. Isolated tornadoes will be possible on Tuesday, especially

in the afternoon hours before the storms organize into a squall line.

Locally heavy rain may lead to flash flooding, especially in urban areas, but widespread excessive rain is

not expected with this system. The West Gulf River Forecast Center will be monitoring flooding potential

along the upper Sabine and and upper Trinity River, but significant river flooding is not expected at this

time.

CONFIDENCE

The greatest uncertainty deals with the location of the dryline in west Texas this afternoon and how far

east the strong to severe storms will move tonight before weakening. Our confidence is greater on the

development of more numerous strong to severe thunderstorms on Tuesday into Tuesday night.

Subject: NWS update: Thunderstorms this weekend

Good afternoon,

After several quiet days following Tuesday's outbreak, it appears that unsettled weather

will return to parts of north and central Texas late Saturday into Sunday. At this time,

widespread severe weather appears unlikely this weekend. We did want to get a message

to you today since any weekend storms could affect outdoor activities and hinder ongoing

cleanup efforts.

OVERVIEW

A cold front will move south from Oklahoma and cross the Red River into north Texas on

Saturday afternoon. The front will move slowly south Saturday night before becoming

stationary near a Goldthwaite to Dallas to Sulphur Springs line early Sunday morning.

Scattered thunderstorms are possible along and north of the front Saturday afternoon

into Saturday night.

More numerous thunderstorms are forecast during the day on Sunday as moisture and

instability increase and an upper level system approaches from the west. The best

chance for thunderstorms will be in areas north of Interstate 20 on Sunday where the

influence of the upper level system will be greatest.

TIMING and IMPACTS

Isolated severe thunderstorms, with a threat of damaging winds and large hail, will be

possible Saturday afternoon and Saturday night in areas north of a line from Goldthwaite

to Dallas to Sulphur Springs. The severe weather threat will expand to include most of

north Texas on Sunday, with damaging winds and large hail the primary threats. On both

Saturday and Sunday, the most likely time frame for a severe storm will be during the

afternoon and early evening hours when the airmass will be most unstable.

All thunderstorms will have a cloud to ground lightning threat, which could affect cleanup

efforts. In addition, the storms may be slow-moving and produce locally heavy rain and

isolated urban flooding.

Thunderstorm chances will continue across eastern parts of north Texas into Monday,

but the severe weather threat appears low at this time.

CONFIDENCE

The moderate degree of instability and relatively weak upper level system is expected to

limit the potential for severe thunderstorms this weekend. If the atmosphere becomes

more unstable than expected, then more intense thunderstorms would result.

Consult our Graphical Hazard Pages and twice-daily Hazardous Weather Outlooks for

any changes to timing or threats this weekend.

BCC: VE List

It is springtime and time for another Ham Expo and VE Test session on the 14th of April…

The testing situation is a little different this time. The test session will begin at 09:30 in the Main (domed) building on the second floor of the EXPO grounds. This change is at the request of the Temple Amateur Radio Club so that people that pass the exam will have a chance to purchase a radio and/or other gear.

I will need the VE’s to assemble at 09:00 for setup and assignment.

I will release the VE’s as quickly as possible as they are no longer needed so that they can have a chance to visit the main hall. The doors open at 07:00 for the general public but VE’s should be able to get in earlier.

VE’s assisting in the testing get in free by showing their VE badge and also will be invited to the ‘post EXPO’ breakfast. TARC might appreciate some assistance from you if you wish to help. They are looking for additional help in setting up on Friday afternoon also.

Please let me know if you will be assisting in the test session…

NOTE TO TARC: People who are coming to the test session ONLY may NOT be charged admission fees to the EXPO. If they wish to visit the EXPO they may be charged. This is an ARRL VEC requirement.

5331. parking at HamEXPO

Yahoo group: Temple_ARC
Date: 2012-04-10 22:09:32 UTC
From: Michael LeFan
Topic: 5331 Message: 5331

PARKING INFORMATION
You may be aware of tight parking conditions at HamEXPO this weekend. There is a Friday night concert by Alan Jackson (7000 to 9000 expected to attend). DO NOT park in the east parking lot in front of the Dome (on the IH-35 side of the facility). HamEXPO will have our regular parking lot. The request is go as far west and north as possible. If it is dry, RVs can park in the grassy area west of the pavement. Also, the parking lot immediately west and outside of our building should be utilized. There are RV hookups available for $20/night beyond the horse barn area (rent at the Expo Center office). Again, DO NOT park in the east parking lot (toward IH-35 side). Thank you and enjoy HamEXPO!

Joe,

Can I get a few numbers from the VE session.

How many paqssed the technician, general and extra class tests?
How many passed more than 1 test?
I know you had one lady that passed all 3 (correct?)
Total people that showed up to take a 1 or more tests?

How many VEs total were there to do the test session.

Need info for our news letter and let everyone know how the VE testing went.

Thanks,

John

5336. 14 April 2012 Belton Ham Expo VE Session Summary

Yahoo group: Temple_ARC
Date: 2012-04-17 15:45:26 UTC
From: Joe Dorn, W5VEX
Topic: 5336 Message: 5336

BCC: VE and SkyWarn lists.

14 April 2012 Belton Ham Expo VE Session Summary

We had one of the larger test sessions at this Expo which was surprising considering the cost of gasoline and the overall economy or maybe people have decided communicating via amateur radio is cheaper than visiting by car, regardless it was a outstanding session.

We tested a total of 33 people resulting in 14 new technicians, 7 new Generals and 4 new Extras. Several passed both Technician and General and one lady went from no license to Extra in one setting. This is the first time a lady has made the big jump in one setting and, as I recall, we have only had one other person do this.

We had an early test session on Wednesday before the Expo for an individual that would be out of state on the 14th and two other people joined him. That session resulted in two Technicians and one General.

We still have at least one more to test from the recent TARC class. The test will be in a private session for a sight impaired individual. We have to read the questions and one of the VE's has to enter the answers so we must have a quite session for him.

We had 15 VE's volunteer their time for the EXPO, some from out of the area.

Local VE's

(Bell, Coryell and Falls counties)

Priscilla Beauregard, KE5UES

John Biles, AD5PB

Sam Clark, WA5DTY

Joe Dorn, W5VEX

Alfred Fronefield, KC5VCF

Jan Gregg, W5GNK

Ross Gregg, W5ANW

Gerald Richmond, N5ZXJ

Gil Rymer, W5GLR

Charles Stout, AE5XL

Kenneth Watkins, KE5ISN

From out of area

Edwin Garcia, N4EGR Westhoff, Texas

Richard Linck, ND5CL Onalaska, Texas

Hurshell Pruitt, WB5MEX Yorktown, Texas

Paul Schattenberg, KF5JIM Austin, Texas

The Wednesday test session was at the Bell County EOC and was hosted by:

Priscilla Beauregard, KE5UES

James Cleveland, N50NI

Joe Dorn, W5VEX

It has always been a pleasant surprise to see how many Volunteer Examiners make themselves available when the call goes out for a test session. Since the group has been put together, we have tested at least 262 people by my sloppy count.

On a side note, James Cleveland, N5ONI could not be with us at the EXPO since, for some strange reason, he felt he had to be in Austin to see his daughter receive recognition for being in the top 4% of the Texas University students for grades. FANTASTIC!!! James is one of our most active VE's.

All participating VE's and one guest are invited to join with the other EXPO workers for an appreciation breakfast at the Temple Luby's at 9:00 AM Saturday. Luby's is located on the east frontage road near IH35, Exit 299.

Thanks for all of the support!!!

5337. Saturday Breakfast

Yahoo group: Temple_ARC
Date: 2012-04-17 16:53:52 UTC
From: Michael LeFan
Topic: 5337 Message: 5337

AN INVITATION

WHO: Everyone who helped with HamEXPO (VEs, helpers, club members serving as EXPO “staff” etc.)
WHAT: Complimentary breakfast
WHEN: Saturday, April 21, 2012, at 9:00 a.m.
WHERE: Luby’s Cafeteria in Temple, on IH-35 at Exit 299 (on the frontage road exit to Loop 363)
WHY: To say “Thank You,” of course
HOW: TARC will buy your breakfast and that of one other, so bring your spouse, a friend—even a hungry stranger

TEMPLE AMATEUR RADIO CLUB appreciates your contribution to the success of HamEXPO last Saturday, so come enjoy breakfast on us!

BCC: my lists

Rick: please forward to your CTARC email list.

I was the one of first users of WinLink 2000 in the area and stayed current on it for several years. Due to lack of local interest, I stagnated. The programs have progressed very much and it is going to be necessary to do a ground up implementation of the software. I will try to document significant steps as I progress.

Winlink 2000 is a system initially developed for sailors and RV'rs to retrieve their email while well a' sea or on the road. The ARRL went looking for a better system of passing emergency traffic than the NTS offered with it's cumbersome and time consuming tier system and put their blessing on WL2K several years ago. The system allows amateur radio stations to interface with the worldwide email system and send and receive email from any authorized user. A ham station can send email to any address but only authorized users may send to ham stations. This restriction is to prevent SPAM.

The system was initially developed for HF and was VERY slow. Pactor modems were integrated into the system but with a high price tag (Pactor III modems are over $700.00) now the WinLink folks have taken a giant step forward with WinMor TNC, a software implementation of the protocol. (This is what has re-stirred my interest.)

.

WL2K uses the internet infrastructure and ALSO an RF backbone so that communications can continue when the wires disappear. Williamson County and the ARRL South Texas ARES groups have been leaders in the implementation of the system. This is significant since our most likely source of wide area communications outages is hurricanes and Bell County (with support from adjacent counties) is a refuge county for Brazoria County. The structure is in place and all we have to do is get the clients in place to join the network.

The WinLink site has excellent education and system information available and is also the interface to the downloads. You get started with an internet only interface and then add hardware as needed. I have had TNC and sound card interfaces in various configurations to show its flexibility.

Subject: NWS Update: Weekend Weather

Good afternoon everyone,

We wanted to send a quick update to relay that the forecast is pretty much on track. There is a stout cap in place across North Texas this afternoon, and this is currently inhibiting organized storms from developing across our region. There is currently a lot of activity along the dry line, from western Kansas and Oklahoma.

Our current thinking has not changed much with the additional data from this morning and afternoon. A few isolated storms remain possible throughout the late afternoon or evening hours, but the most likely scenario is for a line of thunderstorms to develop between Childress and Abilene around Midnight. This line of storms is expected to move east, bringing a good good chance of strong storms during the overnight hours and Sunday. The approximate timing is for the storms to be in the I-35 corridor (both branches of 35 from Gainesville to Salado) before 9 AM...and through the area by 5 PM Sunday.

These storms will be strong to severe, with large hail, damaging winds, and frequent lightning. There is also the potential for isolated, brief tornadoes embedded within the line of storms.

BOTTOM LINE

Thunderstorms are still expected during the overnight hours tonight, as well as on Sunday. Emergency Management and elected officials should be aware for the potential strong to severe thunderstorms during the overnight hours. While much of the focus will be on the large area of moderate to high risk of severe weather to our north, the potential for strong to severe thunderstorms overnight should not be minimized.

5341. RE: Winlink 2000 and WinMor TNC

Yahoo group: Temple_ARC
Date: 2012-04-23 18:47:00 UTC
From: Joe Dorn, W5VEX
Topic: 5338 Message: 5341

Rick.

Please forward.

I have made some progress on my WinLink upgrade to RMS express. I have installed the client programs on my desktop and Icom 7200 computers. My desktop connects to Winlink via Telnet (Internet) and my 7200 is connecting via HF RF using the WINMOR software modem. I do not have a packet version running yet BECAUSE I have not yet made my RMS Packet server work. That's the next step and will be a local area resource.

I had a very pleasant surprise with my Icom 7200 install. I was not aware of its soundcard like interface to a computer. When I purchased the 7200, I included a SignaLink outboard sound card box and have been using it for digital modes. I found out the soundcard interface is not necessary. If you have a 7200 or a couple of other recent Icom boxes (7600?), all you need is a USB cable. This makes for a much simpler setup and operation. I know of only one other person with a 7200 (Kenneth, KE5ISN) and I have been told TARC has two of them for field day. This makes the very rugged, water resistant 7200 an outstanding Emergency Communications rig.

NOTE: you need a separate sound card option so that you don't transmit the Windows sounds. I previously had two sound cards on one computer, one for Windows and one for EchoLink; the SignaLink solution is MUCH better if needed.

If I have gotten your attention then I suggest the following as first steps.

My object is to get local hams using RMS Express, the latest and overall simplest solution for WinLink operation. There will be many references to PacLink, the predecessor to RMS Express. Read for information only. There is also a very good course for PacLink that takes you through the setup for PacLink. The course will expose you to a lot of WinLink but does not cover RMS Express.

'Getting Started with Winlink 2000' is the best guide I have found so far for RMS Express. URL is below.

Go to the winlink.org site and become familiar with the overall operation. In particular:

<http://www.winlink.org/Introduction> http://www.winlink.org/Introduction

<http://www.winlink.org/EmComm> http://www.winlink.org/EmComm

<http://www.winlink.org/node/2> http://www.winlink.org/node/2

<http://www.winlink.org/stations> http://www.winlink.org/stations

<http://www.winlink.org/GetStarted> http://www.winlink.org/GetStarted

Make note of this one. One of the major problems with getting started with WinLink is all of the terms and acronyms.

<http://www.winlink.org/Glossary> http://www.winlink.org/Glossary

NOW DOWNLOAD AND SAVE and start installing:

Getting Started with Winlink 2000

<http://www.winlink.org/webfm_send/184>
http://www.winlink.org/webfm_send/184

I will try to have a RMS Packet site up shortly..

NOTE: packet is used by the system but most f it is handled by the software.

Questions? I am usually available on the 147.14 pl123 repeater.

Subject: Winlink 2000 and WinMor TNC

BCC: my lists

Rick: please forward to your CTARC email list.

I was the one of first users of WinLink 2000 in the area and stayed current on it for several years. Due to lack of local interest, I stagnated. The programs have progressed very much and it is going to be necessary to do a ground up implementation of the software. I will try to document significant steps as I progress.

Winlink 2000 is a system initially developed for sailors and RV'rs to retrieve their email while well a' sea or on the road. The ARRL went looking for a better system of passing emergency traffic than the NTS offered with it's cumbersome and time consuming tier system and put their blessing on WL2K several years ago. The system allows amateur radio stations to interface with the worldwide email system and send and receive email from any authorized user. A ham station can send email to any address but only

authorized users may send to ham stations. This restriction is to prevent SPAM.

The system was initially developed for HF and was VERY slow. Pactor modems were integrated into the system but with a high price tag (Pactor III modems are over $700.00) now the WinLink folks have taken a giant step forward with WinMor TNC, a software implementation of the protocol. (This is what has re-stirred my interest.)

.

WL2K uses the internet infrastructure and ALSO an RF backbone so that communications can continue when the wires disappear. Williamson County and the ARRL South Texas ARES groups have been leaders in the implementation of the system. This is significant since our most likely source of wide area communications outages is hurricanes and Bell County (with support from adjacent counties) is a refuge county for Brazoria County. The structure is in place and all we have to do is get the clients in place to join the network.

The WinLink site has excellent education and system information available and is also the interface to the downloads. You get started with an internet only interface and then add hardware as needed. I have had TNC and sound card interfaces in various configurations to show its flexibility.

If you have an interest, please visit:

<http://www.winlink.org/> http://www.winlink.org/

More later.

From: Joe Dorn, W5VEX
Topic: 5345 Message: 5345

BCC: my amateur radio lists

Rick. Please forward to the CTARC email list.

After years of not having significant information flow from the DFW oriented North Texas Section, especially relating to ARES activities there is now a possible channel for communication. The new Section Emergency Coordinator, John Galvin, N5TIM, has established a Yahoo group for the North Texas ARES communications. Sign up for the group by going to Yahoo Groups and search for NTXARES.

I found out about the group about midnight past in a series of exchanges John and I are having about WinLink, ARES and the upcoming May 5th wide area drill (I believe two hurricane prone ARRL divisions are going to be participating). I found out about the May 5th Exercise while playing with the latest WinLink programs via the South Texas ARES Yahoo Group.

The exercise is based on a no Internet/no cell phones scenario and only RF communications is available. The Winlink programs are vital to pass emergency traffic. Since we are just now finding about the exercise, it will be almost impossible for our area to participate. (Information about Winlink starts on www.winlink.org <http://www.winlink.org/>). Kenneth Watkins, KE5ISN and I have HF WinMor sites working and can pass traffic if needed.

If you have packet capabilities, please download RMS Express and try to connect to my RMS Packet set up at W5VEX-10 on 145.070. Contact me on the145.14, pl123 Eddy repeater if you need assistance.

I will be giving information about the drill as a prelude to a presentation on WinLink 2000 programs at the May 1st CTARC meeting at the Bell County Communications Center in Belton.

5353. WinLink IS UP AND RUNNING!

Yahoo group: Temple_ARC
Date: 2012-05-05 14:51:03 UTC
From: Joe Dorn, W5VEX
Topic: 5353 Message: 5353

Bcc: My Lists

Rick: please forward to the CTARC list.

Also copied to my Brazoria County contacts

I have finally got all of the new WinLink 2000 programs up and working.

RMS Express is the new main player as a client program giving connectivity to VHF and HF with various options. This program is relatively easy to make work and should be the first install for new users. It also brings with it the WINMOR software modem that allows longer communication links via HF.

PacLink is a client program(s) that interfaces into Outlook Express or almost any other email program. It is a little more difficult to install and make work but has its advantages.

RMS Packet is the VHF server that allows connectivity from the client programs above to the internet. I had a great deal of difficulty making this work but it was due to an old overloaded PC. The program installation was simple.

You will need modems or soundcard interfaces to allow the programs to connect.

My VHF RF installation is one you can use for initial contact into the Winlink System. The site is located west of Belton, W5VEX-10 ON 145.070. There are digipeaters located at the local hospitals that will allow 'VIA's into the W5VEX-10 server from most of the adjacent counties. We will be testing the network out over the next several weeks. The Digi's are all on 145.070.

You can locate the hospitals by gong to aprs.fi and clicking on the hospital icons. The ones with W5BEQ and W5AMK as calls are in our network.

We need more RMS VHF Packet sites in the area. If you have a spare radio and TNC you can dedicate to the service, I will assist you with the technical part.

There is a RF only exercise in progress as I write that I will be joining shortly. Listen in on 7285 and 7290.

I believe I am up to speed on the essential WinLink RMS programs to give assistance as needed so go to Winlink.org and read about and then download the programs. They are all FREE!

I am usually available on the 147.14 repeater.

Also I encourage all of you to join the new North Texas ARES Yahoo group. Go to the Yahoo Groups site and request membership in NTXARES.

To: undisclosed-recipients:
Subject: NWS UPDATE: Thunderstorms

Good afternoon everyone,

There continues to be a chance of thunderstorm development across North Texas late this afternoon and this evening. At this time thunderstorm chances look best for locations along and north of the Interstate 20 corridor this evening; however there is at least a low chance chance of storms across the entire area through tonight. Assuming storms develop, they may produce damaging straight line winds and hail up to the size of a half-dollar. A graphic has been attached which shows in red those areas that we feel are most likely to experience severe weather through tonight.

OVERVIEW
A cold front is moving southeast out of the Texas panhandle early this afternoon. This front is expected to be located near a Wichita Falls to Olney line by 7 pm CDT. Our primary concern is that a line of thunderstorms will develop along this front and then intensify and move east-southeast off of the front as a strong linear thunderstorm system. If this pans out, this linear thunderstorm system will move east-southeast towards Interstate 20, within the red scalloped region in the image. Isolated thunderstorms are possible across North Texas away from the front...however these storms are not expected to be quite as strong as storms that develop near the cold front.

AREA
Areas most likely to see severe weather are those areas generally

extending from Wichita Falls to Olney and then southeast to Interstate 20. Isolated strong to severe storms are possible across all of North Texas.

IMPACTS & TIMING
Assuming the linear thunderstorm complex takes shape, it will be capable of producing a broad swath of damaging straight line winds. It is expected to develop near the cold front around 7 PM CDT and then move east-southeast thereafter. Current timing which is largely based on model data brings the system to the northwest portions of the metroplex by 9 PM CDT. The system then exits the metroplex to the east-southeast after 11 PM CDT. The system would then exit North Texas to the east-southeast after 1 AM CDT.

FORECAST POSSIBILITIES
Thunderstorm activity from last night has actually removed a significant amount of moisture from the region for thunderstorm development today. In order for this squall line/strong linear thunderstorm system to develop we need low level moisture to return out ahead of the cold front before 7 PM. Strangely enough, if moisture is able to make it, it will move into North Texas from the southwest instead of from the Gulf of Mexico which is typically the case. The primary reason we think this squall line will still develop is because we can see this return of moisture has already made it as close as Abilene early this afternoon. While this does not guarantee moisture will make it in time, it is close enough for us to continue to think ingredients will be in place for a severe line of storms to develop along the cold front around 7 PM. We will continue to monitor the progress of this moisture throughout the afternoon hours and update the forecast if storms along the front look more or less likely for this evening.

BOTTOM LINE
Emergency managers, elected officials, and anyone with outdoor plans this evening should closely monitor National Weather Service forecasts, outlooks, and graphics for updates. If a strong linear thunderstorm system develops, the straight line wind potential could be very hazardous for outdoor activities and festivals...especially where tents have been constructed. The best news is that this system should initially develop away from the metroplex, where most of the outdoor activities are concentrated.

Subject: Severe thunderstorms and heavy rain possible this afternoon into Tuesday

South Central Texas Partners...

After a month of dry weather the pattern is changing. In particular this evening, a cold front will be approaching and slowing moving through south central Texas from the north. This front, along with disturbances coming in from the southwest, will be the trigger for showers and thunderstorms this evening, and into the overnight hours tonight.

A flash flood watch has been posted from 4 pm this afternoon...until 4 pm on Tuesday for widespread rains of 1 to 2 inches...with isolated totals as high

as 3-5 inches. The watch includes all of the Hill Country and includes the counties mainly north of Highway 90 and west of I-35. I have attached a graphic showing the watch area.

In addition to the heavy rain...there is a chance for severe thunderstorms mainly over the far western areas this afternoon and evening...in an area primarily west of a line from Kerrville down to Carrizo Springs. Large hail and severe wind gusts are possible. Like we have seen the last couple of days...the severe threat will primarily be during the daylight hours...with lingering chances through the evening before midnight. Late at night, the threat will shift over to the flash flooding as the front sags through the area and chances of thunderstorms continue...as a large "cluster" of storms develop. Even after the front pushes through...there should be enough energy to keep the storm chances going through Tuesday night.

An additional heavy rain threat will also come later in the week with an upper low moving across the state during the Thursday/Friday time frame. It is still too to pin down exact timing, but looks like Thursday afternoon/night would be the high impact time of this 2nd event. More on this in later emails.

For additional information....check out our homepage at www.srh.noaa.gov/ewx

As usual, BCC: to a bunch and Rick please forward to the CTARC list

(I BCC to prevent my groups from being spammed. If you would like to be added (or removed) to my SKYWARN OR WINLINK list, send me an email with the request.)

I have several people that have expressed an interest in installing a RMS Express VHF link. A modem or sound card interface is needed for this type of installation. If you have one gathering dust and would like to contribute to the Central Texas Amateur Radio Network please contact me at:

jbdvex@...

Especially desirable are the Kantronics units but others might work. I will verify them if I can test them a couple of days. A fair price will be established.

The preferred course of action is that you tie them back to your radio and install RMS Express and become a part of the network. This is a great program and takes the work out of going 'Packet'. W5VEX-10, 145.070 is up and available for your testing in the central Bell County area. I installed RMS Express and had it working in about 10 minutes on the Bell County EOC computer while carrying on a conversation with the other net control operator during a recent exercise. Come on in the water is fine.

To: Mark Fox
Subject: NWS UPDATE: Monday

Good afternoon everyone,

There is another chance for scattered thunderstorms late this afternoon and overnight. This time around, it appears that more of us will receive rainfall, but not everyone. There is a potential for severe weather, as the storms move in from the south and west. An image has been attached to this email that will show the area that could see some severe weather this evening, which will mainly be south of Interstate 20.

OVERVIEW
A cluster of thunderstorms has developed around San Angelo. These thunderstorms should move slowly east and northeast throughout the remainder of the afternoon and evening. A cold front is draped just to the north of Interstate 20, and this front will continue to slide southward through the evening hours. The thunderstorm complex near San Angelo will move eastward, while additional thunderstorms are likely to form along the cold front. Showers and thunderstorms should be most common well south of Interstate 20, but scattered showers are likely to develop anywhere across north Texas.

AREA
Isolated showers or thunderstorms are possible just about anywhere across north and central Texas. The possibility for severe weather is most likely south of a line from Paris to Dallas to Comanche.

IMPACTS & TIMING
Impacts from any thunderstorms will be much like what we have seen for the past two days. Scattered areas that will see large hail, likely up to ping pong ball size, along with occasional wind gusts to near 60 mph.

BOTTOM LINE
Emergency managers, elected and public safety officials should closely monitor National Weather Service forecasts, outlooks, and graphics for updates. Spotter groups should be prepared for the potential to be activated during the evening hours.

5359. FW: [WC-ARES] Fw: Heavy Rain Outlook for Wednesday through Friday, May 9-11

Yahoo group: Temple_ARC
Date: 2012-05-08 22:28:35 UTC
From: Joe Dorn, W5VEX
Topic: 5359 Message: 5359

My usual BCC:s

Well another system found a way to NOT give significant rain to Bell County, however hope springs eternal. Another heads up for later in the week from our NWS friends in Austin/San Antonia NWS.

----- Forwarded Message -----

Subject: Heavy Rain Outlook for Wednesday through Friday, May 9-11

Weather Partners,

The severe threat has ended for our area and rain will continue to taper off this evening, so the Flash Flood Watch will expire at 4 pm. The stationary front will remain in the area on Wednesday, and a weak upper level disturbance will bring scattered showers and thunderstorms, but nowhere near the extent of the past few days.

The bigger story is a large upper trough now over southeast California, which will move across the area Thursday afternoon into Friday. This trough, the still stationary front, and a moist, unstable conditions will bring all the ingredients for very heavy rain and flash flooding. While we don't have a specific area to focus on yet, we anticipate issuing a new Flash Flood Watch for the entire area beginning sometime on Thursday. Additional rainfall later in the week could average 1 to 3 inches, with some locations receiving in excess of 5 inches. Since creeks and rivers will be running high from the rain of the past few days, this additional rain will go almost entirely to runoff and thus flash flooding and potentially river flooding.

We plan to update the outlooks each day, and as always, the most complete information including graphics is our webpage:
http://weather.gov/austin

South Central Texas Partners...

Highlights...The much anticipated weather event is coming together over portions of the area this morning...still waiting on the main impacts later today and tonight. A Flash Flood Watch is in effect until Noon on Friday. Severe Thunderstorm Watch is in effect for western sections of South Central Texas until 1 pm this afternoon. The severe threat will spread to most if not all of the area by this afternoon and evening. More watch boxes are anticipated. Heavy rain threat will increase by tonight. The main impacts of this storm system will keep us busy for the next 24 hours. Have attached a graphic.

The large upper low is currently over northern Mexico just to the south of El Paso. It is already causing widespread thunderstorm activity near the Rio Grande...spreading these storms into South Central Texas. We have already seen severe thunderstorms early this morning. The atmosphere is primed to give us large hail and damaging wind threats. The threat for tornadoes is also on the increase, especially across the southern half of Texas...so cant rule them out today as well. Look for additional Severe/Tornado watches to be issued today for all or portions of the area.

The southern half of South Central Texas will see the largest severe threat.

With such a large storm system...it is hard to pinpoint when and where the next storms will form. There wont be 24 hours of continuous rain...but passing clusters of storms...each one capable of producing quick bursts of 1+ inches of rain. Overall widespread rain totals of 2-4 inches are likely...isolated totals through tomorrow afternoon could exceed 4-6 inches in some spots. The heavy rain threat this morning and afternoon will be in areas that see "training" storms, storms that move over the same location. Later tonight...storms will likely slow down as the upper low gets closer and a very large cluster of storms develops...increasing the chances for flash flooding. The main impact time of the widespread heavy rainfall should be from about 8 pm tonight until 8 am on Friday morning. Be cautious if driving the next 24 hours...especially tonight. Low water crossings will likely flood. It will be a good night to stay home and off the roads. Turn Around Dont Drown.

It is going to be a busy 24 hours...with all elements of severe weather possible...Hail, strong winds, flash flooding, and even an isolated tornado possible. Keep watch of the weather very closely...go to our weather service website for the latest information on watches/warnings/advisories...and watch the radar closely. www.srh.noaa.gov/ewx

If time permits...will try to send out another update this afternoon. Be careful...stay safe.

Subject: NWS UPDATE: Thunderstorms / Locally heavy rainfall

Good afternoon everyone,

Rain chances continue to increase through the day today, and will increase again during the overnight hours, as well as on Friday. While most of the rainfall is welcome and isn't anticipated to cause too many issues, there will be the potential for localized areas to receive heavy rainfall, leading to localized flash flooding. A Flash Flood Watch has been issued for areas south and of a line from Comanche, to Waco, to Hearne. A short PDF has been attached that shows the expected rainfall pattern through Saturday.

OVERVIEW
A potent upper level storm and a thunderstorm complex are currently affecting areas of south Texas. This same storm system will move north and northeast over the next day or two, allowing for much of north and central Texas to get beneficial rainfall. Widespread areas of 1 to 3" of rainfall are possible in central Texas, with a few pockets of higher amounts. The severe potential with this round of thunderstorms is low, but since it is May.all storms will be monitored for the potential for hail.

AREA
South of Comanche, Waco, to Hearne is the area most likely to be affected by isolated flash flooding overnight and tomorrow. Not everyone in this area will see heavy rainfall, nor will there be flash flooding everywhere. The storms that develop are likely to be relatively slow movers, allowing for localized heavy rainfall. The exact areas that will have the highest potential for flash flooding will depend on small scale features, and all rainfall will be monitored closely for runoff.

IMPACTS & TIMING
Localized heavy rainfall is the primary concern with this storm system. The further south you are, the higher your likelihood of a thunderstorm which could produce hail. The heaviest rainfall is likely to occur this evening, overnight tonight, and during the daytime hours on Friday.

CONFIDENCE & FORECAST POSSIBILITIES

There is moderate confidence in the forecast for flash flooding somewhere in the flash flood watch area. The best forecast we have right now is to expect the thunderstorm complex to increasing in strength from Austin southward. If this were to happen, upper level energy will be enough to produce a line of thunderstorms affecting much of the area between 9 PM and 3 AM, before diminishing to occasional showers during the day on Friday.

The evolution of the ongoing complex of thunderstorms in south Texas will be critical to the final outcome of where and when the heaviest rainfall will occur. One key to watch from the complex to the south: if the ongoing thunderstorms move (relatively) quickly to the north, that would increase moisture levels and rainfall potential for our area.

BOTTOM LINE
Emergency managers, elected and public safety officials should closely monitor National Weather Service forecasts, outlooks, and graphics for updates for this situation, especially during the evening and overnight hours. Widespread activation of spotter groups is not likely, except for those groups who routinely are on the lookout for flash flooding concerns. Areas that traditionally fill up with water during heavy rainfall events should be monitored closely through the evening and overnight hours.

5367. Whoops... Lost power...

Yahoo group: Temple_ARC
Date: 2012-05-11 10:13:43 UTC
From: Joe Dorn, W5VEX
Topic: 5367 Message: 5367

We have had very little severe weather activity over the past several years and because of this dust has gathered on our operations, As an example, last evening while preparing for the weather event a question came up as to which repeater we wanted the backup Echolink connection on. We made the right choice, but not for the right reason, in deciding to leave it on the primary SkyWarn repeater. The reason we left it on the primary repeater was because I had some problems a week or so ago with connectivity, not because of the redundancy we initially planned for in case of lighting or other storm related event took my connection off line. In the last two weather events, I have lost power, the first just for a few seconds, last night for a prolonged period where the secondary connection became the significant NWS interface.

In the last three years, most of my UPS batteries have turned back to lead and I have not replaced some of the less critical ones including the one on the computer and radio I use during weather events. (I think the one on the Echolink equipment is good but I haven't tested it.)

What I am leading up to is that we all tend to become complacent when the spring breezes blow easy and we let stuff just be stuff. Then the time comes when we need equipment and what we have is stuff. I personally have several items that have 'Stuffed' and I was not aware of it or just took a 'so what' attitude. I will be replacing or repairing the UPS boxes, I have a tracker not working in what is currently my main vehicle, I had to do extensive reprogramming to get my Winlink system back in operation and I am sure several small items need battery replacement.

Please check out your 'stuff' and be ready for the next 'unexpected' event. Magmount antennas tend to develop cable and connection problems and power connections corrode. We forget which buttons to push when on those wonderful 'all the bells and whistle' boxes and then we can't find the manuals. And all of those 'AAA' and 'AA' batteries do have a shelf life.

I especially ask that all of you mobile spotters with trackers check them out. I am available most of the time to assist with the check out and/or offer advice.

FWIW.

Subject: [TARC] Hurricane Preparedness links

Hurricane Preparedness Week 2012 runs from May 27th through June 2nd.

Hurricanes are common occurrences in Texas. Texas is a large state with diverse geography, climates, weather and people. Many types of natural disasters threaten Texas, including hurricanes, wildfires, floods, tornadoes, winter storms and more. Some parts of Texas are more vulnerable to tropical weather whereas other parts experience frequent tornadic activity so it's important to learn about the emergencies most common in your area.

Are you prepared? Follow the Following Steps to Preparation: Be Ready Texas!

Watch Surviving Disaster Video: http://www.texasprepares.org/survivingdisaster.htm (English) http://www.texasprepares.org/Spanish/Compartir.htm (Spanish) http://www.texasprepares.org/campaign/Download_and_Accessible_Videos.htm American Sign Language in English and Spanish

5371. Appointment to ARRL District 6 District Emergency Coordinator

Yahoo group: Temple_ARC
Date: 2012-05-12 22:54:05 UTC
From: Joe Dorn, W5VEX
Topic: 5371 Message: 5371

BCC: several of my ham lists.

As some of you have already heard, I have been appointed as the new ARRL District 6 District Emergency Coordinator by The ARRL North Texas Section Manager Walt Mayfield, KE5SOO and the North Texas Section Emergency Coordinator John Galvin, N5TIM.

I did not seek this job but in discussions with Walt and John I felt that I could be a contributor to some of the programs and changes they are trying to implement and decided to accept the appointment for a limited time. Most of the hams I am closely associated with know that I have been trying to retire from some of the activities I have been active in but people who tend to say yes are easy targets.

The DEC's job is to interface with and support the county EC's and act as their representative to the Section. I will be available to speak with any amateur radio group in the district by invitation.

The District is comprised of the following counties: Bell, Bosque, Coryell, Falls, Hill, Lampasas, McLennan and Somervell.

A short review of my amateur radio and related activities follows.

I was the EC for the Temple Amateur Radio Club in 2002-2004 and have been active with the Bell County Reservists, the support group for the Bell County EOC. I was active with the Williamson County ARES group until my night vision went bad (been fixed). I am one of the net control operators during local SKYWARN events and have given presentations in the annual SKYWARN training sessions. I found the money for and am the trustee for the 147.14 wide area repeater. I also found the money for, planned and installed (with assistance) a 13 hospital network for the Central Texas Trauma Council (RAC-L).

Gerald Richmond, N5ZXJ did the planning and very successful installation of the 147.14 and 145.31 wide area repeaters. Gerald and I also worked together to get the hospital network planned and installed with little additional assistance.

I worked with Mike Heskett, WB5QLD to implement the first EchoLink connection to a NWS location that has proven to be a tremendous tool and was one of the first amateurs to install WinLink 2000 after the ARRL placed its blessing on the program(s).

I have mentored about 180 students in all three levels of the ARRL Emergency Communications Courses. I also formed a VE group that has given amateur radio test to about 300 people. I have taught a 14 session Weather 101 course for the Austin Power Squadron, a boating education group.

I continue to support the Bell County Reservists (as needed) and I am very active with the Central Texas Amateur Radio Club, a multi-county emergency response club..

I will need the support of all of you to bring ARES support to all of the counties in the District. More will be following..

The 147.14, pl123 repeater covers the entire district and then some. Please join the weekly net on Thursdays at 8:00 PM.

Please subscribe to the NTXARES Yahoo group to stay informed about the North Texas Section activities..

Subject: [TARC] Congratulations to Joe Dorn

Congratulations Joe !
I always prefer to see individuals who are ACTIVE get the position titles, and not go to those who do not participate in the related activities.

Knowing that you are active with the Emergency Operations Center and know what they do first hand and your experience makes you the best choice for this.

I believe the Region 61 RACES representative position should also have an opening, and am not sure if you have this also.
Please look at the volunteer group and select and individual who will active participate to take the lead (and sometimes net control) for Region 61 and also the Bell County 61-027 responsibilities.

RACES is a State of Texas group run by the State Operations Center.
ARES is an ARRL and Sponsored organizations group. The same person can lead both or they can be different individual. Out Temple Amateur Radio Club would like to know who they are for our bulletin.

Well done.

Please don't confuse my offering of congratulations as any request or suggestion for it is not intended to be such in any way. You are the one who does know who is active and who the best volunteers in our area would be.

Please speak with them about taking responsible positions. Thanks for all that you have done for our community.

Mike Hankins, TARC board.

5374. ARES Membership Application

Yahoo group: Temple_ARC
Date: 2012-05-14 22:36:28 UTC
From: Joe Dorn, W5VEX
Topic: 5374 Message: 5374

I have uploaded an ARES membership application to the files section of the TARC and BCRES groups.

If you are interested in becoming an ARES member please fill out the form and return it to me, electronically (preferred), by hand or by mail (address below).

The ONLY requirement for ARES membership is that you have a valid amateur radio license and a desire to support emergency related organizations in the area.

If you can not access the files area of the Yahoo groups, send me a private email and I will send one to you. at

BCC: My lists.

Another weather system is approaching our area from the west. The information is from the EWX weather office (Austin/San Antonio) but the system could bring lake filling rains to our area also. I expect a similar description from FTW in the next few hours.

Subject: Heavy rain and severe threat later today into Tuesday

South Central Texas Partners...

Highlights: Yet another upper level storm system is making its way toward the area, bringing the threat for thunderstorm development later today, tonight, and into Tuesday. The main threats will be heavy rain and hail/strong winds with thunderstorms over the western half of South Central Texas. A Flash Flood Watch has been posted until Noon Tuesday for areas west of a Kerrville to Pearsall line.

Discussion: The upper level storm system, spinning near the TX/NM border...will move southeast today and tonight. There is already a large cluster of thunderstorms associated with this system over West Texas. This cluster of storms is forecast to remain intact and move east and southeast

into portions of Southwest Texas and western areas of South Central Texas. This cluster of storms will likely affect these areas during the late evening/overnight hours with heavy rain and strong to severe thunderstorms. Over the past week...many areas have had several inches of rain. This same area near the Rio Grande river got hit last night with several inches of rain. Thus a Flash Flood threat exists for this area as additional 1-3 inches of rain are possible overnight, with isolated totals near 5 inches.

The largest Flash Flood threat exists for areas west of a Kerrville to Pearsall line...extending to the Rio Grande River. The storms over the past week have been producing very high rain rates, on the order of 2-3 inches per hour. This intense rainfall will very quickly cause flash flooding. The Flash Flood Watch is in effect from 7 pm this evening until Noon on Tuesday for Bandera, Dimmit, Edwards, Frio, Kerr, Kinney, Maverick, Medina, Real, Uvalde, Val Verde, and Zavala Counties. I have attached a graphic showing the Watch area. Other areas outside of the watch area will have a chance of thunderstorms overnight with this system, but at this time am not expecting enough rainfall to cause widespread flooding. However, can't rule out some minor flood issues elsewhere especially in the urban/city areas.

Along with the heavy rain threat, some of the storms may be severe with large hail and damaging winds. The severe threat will primarily last through the late evening hours to just past midnight. Keep in mind that with the rains have loosened the soil, making trees susceptible to uprooting. Attached a graphic of this threat area.

The storms should be moving out of the area by morning, but can rule out scattered rains/storms on Tuesday as the upper low exits the area. The main impacts however should end by Tuesday AM.

Keep monitoring the weather on our webpage at (www.weather.gov/austin) or (www.weather.gov/sanantonio) for the latest watches/warnings/advisories. This may once again be an overnight rain event for portions of the area that are very susceptible to flash flooding. Creeks and streams may go over their banks very quickly. Some area road closures are likely in the Watch area.

Joe, I want to personally thank you for the continued flow of weather info you provide. My family and I travel frequently up and down the 35 corridor from Plano/Dallas to San Antonio and it sure is helpful to know what to be looking for weather-wise. In face, my wife is traveling by herself as we speak Plano/San Antonio/Plano. Unfortunately Channel 8 in Dallas thinks the map stops at Hillsboro and sometime Waco and often mention nothing when you have advised of severe weather possibilities through Temple, Salado, Austin and San Antonio.

Thanks again for the heads-ups. Keep up the good work. Your efforts are appreciated.

5377. FW: [BLT] W5KUB Video is now active enroute to Dayton

Yahoo group: Temple_ARC
Date: 2012-05-16 20:58:52 UTC
From: Joe Dorn, W5VEX
Topic: 5377 Message: 5377

The info below is about live streaming from the Hamvention in Dayton...

I have been connected most of the day while they travel toward Dayton, a beautiful day to be on the road. If you have not been to the Hamvention this might make you want to go. If you have been, it will be a nostalgic review.

There is no way a camera can catch the enormity of either the event or the number of people attending, exhibits and displays.

I was a volunteer in the ARRL part of the display areas three years ago and absolutely enjoyed it.

Subject: [BLT] W5KUB Video is now active enroute to Dayton

Video is on looking out the windshield with good audio too.

This will be our 10 th year to broadcast Dayton Hamvention . Our viewers have grown to about 50,000 in over 150 countries during the last Hamvention broadcast.

Hamvention is May 20-22 but we actually go live TOMORROW at 1300 UTC Wed May 16th as we pull out of our driveway and broadcast the 550 mile drive live. The video site is http://w5kub.com and we are on 365 days a year when not broadcasting a live ham event. Over the years we have had special guests on the broadcasts. We have over $8000 in prizes to give out again this year to lucky viewers. Some of our prizes are weather stations, Heil headsets, Comet CAA-500 antenna analyzers, AlphaAmp watt meters, D-star radios, yasue HTs, TenTec desk mics, G5RV antennas, and much more. After hamvention, we will be broadcasting our 550 mile trip back to Memphis on Sunday afternoon.

We have installed a new Ka Band internet satellite uplink this year in our fleamarket space so we will be broadcasting High Def video this year. This is a first for us. Log into the chat room and talk directly to us, ask

questions to those we are interviewing or just chat with each other.

Dayton Hamvention is Fri, Sat, Sun May 18,18,20. We also will broadcast the 550 mile drive (10 Hours) from Memphis, TN to Dayton Ohio Wednesday may 16. We will be setting up our fleamarket space and the satellite uplink on Thursday May 17 and will broadcast that.

We will start giving out prizes on Wed morning. Go to http://w5kub.com for all the fun, and also join us on our facebook broadcast page at https://www.facebook.com/groups/279273778772594/

Thanks, Tom W5KUB

This message is going to EVERYONE who is registered on the YAHOO group of Temple_ARC. If you already paid, many thanks !

There are a few people who have not paid the membership dues yet.

Some of those no longer attend the meetings, and also were not at the Christmas party. If you stop receiving the US Postal bulletin you may need to check if your membership is paid for 2012 !

There are a few who asked about dues at the Christmas dinner, and I said wait until the club meeting to pay dues. It is only a couple of people. Most of those paid a the last meeting.

I will not publish a list of those not paid, except to the board members. Feel free to ask me if you are not sure.

Those who wish to remain members may pay by check to our PO Box 616 Temple, TX address, or PayPal from the TARC.ORG web site or pay me on March 1st at the club meeting.

Everyone please come to the TARC meeting the first Thursday of March.

That's right, March 1st. We will vote on a change to the By-Laws, concerning "Family Membership".

5384. Looking for hardline

Yahoo group: Temple_ARC
Date: 2012-05-25 16:08:21 UTC
From: unknown name
Topic: 5384 Message: 5384

The 3M ARC in Austin is working on a repeater project supporting the local Civil Air Patrol (CAP).

They are supplying all the hardware and we are providing the location. They are on a tight budget and shopping for hardline at a good price (new or good used). We need approx. 115ft + - 5. Half inch hardline will work as well as 7/8. If anyone has info on a source , could they please either email me or call my cel number?

Our target install date is June 16 so that's pretty tight scheduling to try shopping at Ham Comm (Plano) unless we can make arrangements for pick-up and go.

If anyone has contact info for "Larry" (thin with bushy hair) who normally has bunches of stuff at hamfests could you please let me have that info? He is the guy who normally occupies lots of floor space at the Belton Hamfest.

Thanks for any help,

Tom W2MN

5385. FW: Strong to severe thunderstorms possible on Thursday Afternoon-Night

Yahoo group: Temple_ARC
Date: 2012-05-30 22:23:48 UTC
From: Joe Dorn, W5VEX
Topic: 5385 Message: 5385

This is an example of why I watch both the NWS sites that cover or nearly cover our area (CWA in weather speak). At the moment Fort Worth has not issued any updates for our area since they are concerned with the DFW area and the system along the Red River. The EWX (San Antonio/Austin) EWA has major population centers just to our south and stay on top of that area.

I have just noticed we have a Tornado watch at this time for our western counties. The bad stuff is about 125 miles away so keep your radio on. Aaron, KE5TNR is headed toward it, my first alert as a rule.

Subject: Strong to severe thunderstorms possible on Thursday Afternoon-Night

South Central Texas Partners...

Headlines: A late season front will start to push through South Central Texas on Thursday afternoon bringing a chance for thunderstorms, some of which may be strong to severe. The main threats will be large hail and damaging wind gusts. Northern areas will be under the threat during the late afternoon hours...with the threat spreading south during the evening...possibly extending past midnight.

Discussion: A front will sag south during the day on Thursday...approaching the northern areas of South Central Texas by the late afternoon hours. The warm and humid air ahead of the front will likely be the fuel for thunderstorm development along the front. Storms that form to the north over Central Texas...will likely push south into the area and affect the northern half of South Central Texas during the 4-8 pm time frame. The storms that do form will likely bring the threat for large hail and damaging wind gusts. Locally heavy rain will occur under the storms, but this is not shaping up to be any sort of big rain event. In fact the storms will be scattered in nature, meaning some areas will not see any storm development

at all.

The storms that form along the front and outflow boundaries will likely continue south and east, pushing through most of south Central Texas during the late evening hours until around midnight. After midnight, most of the severe weather threat will have ended. Some lingering showers/storms may occur over the far west or along the coastal plains, but any severe threat will likely be over by Friday morning.

As of right now...the NWS Storm Prediction Center has nearly all the area under a "Slight" risk of severe weather. Have your weather radio nearby on Thursday as advisories, Watches, and Warnings are possible. Stay tuned to www.srh.noaa.gov/ewx

Tomorrow, I hope to provide better details on the event with regards to timing and impact area.

SB SPCL ARL ARLX007
ARLX007 Take Part in the Annual On-The-Air Station Test from WX4NHC at the National Hurricane Center

The annual WX4NHC On-the-Air Station Test from the National Hurricane Center (NHC) in Miami will take place Saturday, June 2, 1300-2100 UTC (9 AM - 5 PM EDT). "The purpose of this annual station test is to test all of our radio equipment, computers and antennas using as many modes and frequencies as possible in preparation for this year's hurricane season," said WX4NHC Assistant Amateur Radio Volunteer Coordinator Julio Ripoll, WD4R. "This is not a contest or simulated hurricane exercise."

WX4NHC will be on the air on HF, VHF and UHF, plus 2 and 30 meter APRS. Suggested SSB frequencies are 3.950, 7.268, 14.325, 21.325 and 28.525 MHz, +/-QRM. Ripoll said that WX4NHC will mostly be on 14.325

MHz, but will make announcements when the station changes frequencies. WX4NHC also will be on the VoIP Hurricane Net 1700-1900 UTC (IRLP node 9219/EchoLink WX-TALK conference node 7203) and on South Florida area VHF/UHF repeaters and simplex. Stations looking to participate in the annual station test may be able WX4NHC on HF by using one of the DX spotting networks, such as the DX Summit website.

Stations working WX4NHC exchange call sign, signal report, location and name, plus a brief weather report, such as "sunny," "rain" or "cloudy." Non-hams may submit their actual weather using the Online Hurricane Report Form at, http://www2.fiu.edu/orgs/w4ehw/WX-form1.html. QSL cards will be available. QSL via WD4R and include a self-addressed, stamped envelope. Do not send cards to the NHC. Due to security measures, no visitors will be allowed at NHC during the test.

The 2012 Atlantic hurricane season began Friday, June 1 and goes through November 30. According to the NHC, forecasters are calling for a "near-average" hurricane season this year.

** Ham-Com 2012 and the NTX Mentor Learning Center

The ARRL North Texas Section would like to invite all Hams to attend Ham-Com 2012 and visit our Ham Learning Center! This event, the West Gulf Division Convention, is a great way for Hams, especially those recently licensed, to meet and learn about a variety of subjects. Amateur radio operators have a great tradition of helping each other learn about and gain experience in the many facets of the hobby. The mentor booth is designed to build on this tradition by providing a place for Hams of all ages and experience levels to come together, exchange knowledge and make new friends while having fun and enjoying the great hobby of Amateur Radio.

The Mentoring Booth will be open to answer questions for newly licensed and experienced hams alike. Need a new radio? Upgrading? Antennas? Call signs? Other equipment? Nets? Public Service? Stop by and ask one of our volunteers.

If you have something Amateur Radio related that you would like to show and tell about, please consider attending Ham-Com 2012 and stopping by our booth. "Elmers" (ham-speak for mentors) will be available for informal discussions on just about any topic.

The North Texas Section Booth will be located across from the Ham-Com registration booth.
For more information on Ham-Com 2012, please see:
http://www.hamcom.org/

>>>>>>>> Volunteers needed for the Mentor Booth <<<<<<<<<<<
We also need volunteers to man the booth and answer questions and track visitors.

Please consider sharing your wealth of knowledge and volunteer at our booth.

We need volunteers who like to talk about:
1. Current radio equipment available.
2. Local youth activities and programs.
3. HF operations including digital modes
4. Ability to answer technical questions.

If you are interested in being a volunteer please go to
http://tinyurl.com/ntx-mentor to sign up.

** ARRL NTX Forums at Hamcom 2012

ARRL NTX Section Manager Walt Mayfield, KE5SOO will be conducting a NTX Section forum at Hamcom 2012. The forum will be at 10am on Saturday June 9th in the Hillhaven room. During this time you will get to meet the NTX Section Leadership, hear Walt's NTX Section Goals and Objectives, participate in a question and answers portion at the end.

ARRL NTX Section Emergency Coordinator John Galvin, N5TIM will be conducting an ARES forum Hamcom 2012. The forum will be at 9am on Saturday June 9th in the Hillhaven room.

This year there will not be an appointee meeting as your time to participate in HamCom is valuable. We will be conducting more leadership webinars this year.

** ARRL Field Day!
Field Day is June 23-24, 2012

Is Field Day a contest, an emergency preparedness exercise, a public relations demonstration, a great event for clubs, or just a fun way to get on the air? Field Day is ALL these things! Hams set up away from commercial power and normal installations for 24 hours in June.
ARRL Field Day is the single most popular on-the-air event held annually in the US and Canada. Each year over 35,000 amateurs gather with their clubs, friends or simply by themselves to operate.
ARRL Field Day is not a fully adjudicated contest, which explains much of its popularity. It is a time where many aspects of Amateur Radio

come together to highlight our many roles. While some will treat it as a contest, most groups use the opportunity to practice their emergency response capabilities. It is an excellent opportunity to demonstrate Amateur Radio to local elected community leaders, key individuals with the organizations that Amateur Radio might serve in an emergency, as well as the general public. For many clubs, ARRL Field Day is one of the highlights of their annual calendar.

**Licensing Exams

The North Texas Section has 16 Licensing Exams occurring at different locations in June.
For more information please see:
http://www.arrl.org/find-an-amateur-radio-license-exam-session

All,

We need volunteers to help at the Mentor booth this Friday and Saturday. I only have 3 folks signed up so far. As I get more I will post a schedule. Please pass this around to folks who might be interested.

If you are interested in being a volunteer please go to http://tinyurl.com/ntx-mentor to sign up.

5390. Getting Started with WinLink 2000...

Yahoo group: Temple_ARC
Date: 2012-06-08 03:19:48 UTC
From: Joe Dorn, W5VEX
Topic: 5390 Message: 5390

First, I would like to thank the Temple Amateur Radio Club and the Central Texas Amateur Radio club for their support on the purchase the Pactor 3 modem.

Now we need to set up to use it.

For those of you that would like to get involved with Winlink, an excellent starting point is:

http://www.winlink.org/webfm_send/184

More information is available at:

http://www.winlink.org/GetStarted

the home site is:

http://www.winlink.org/

There is A LOT of information and data out there and it is confusing up front but I find it one of the more fun things to play with in amateur radio.

I can help on a lot of 'new user' type questions and can usually be contacted on the 147.14 repeater; however I will be in Plano for the next two days.

5391. Field day tomorrow

Yahoo group: Temple_ARC
Date: 2012-06-22 15:49:52 UTC
From: Darwin Geiselbrecht
Topic: 5391 Message: 5391

Well tomorrow it comes around again. Some thoughts this morning - probably more as the day continues and I get the truck packed.

1. I am not going to go all out on the food this year. I will bring the big electric roaster oven to do the meat in. It can be set to slowly heat during the afternoon. My thoughts are that we will just go to HEB in the afternoon and get everything - meat, bread, utensils, condiments etc. at once. Plan is to do some of the link sausages and hot dogs with big buns. Chips and some of the salads (cole slaw etc) to go with it. Cookies for desert unless folks bring something else. We need to load up the club coolers with water, drinks and ice in the morning though.

2. Myron pointed out that we have lost some of our support trees so we may have to go to the inverted vee configuration for the dipoles. I will bring a few extra fiberglass poles to supplement what the club has. Using them we will have to improvise some end supports. But they only have to be 8 or 10 feet high - just enough to keep folks from running into the end. Also we will need to tack up the club halo for six on a short pole. John is also bringing a NVIS antenna for 80 and 40.

3. I will bring the two pelican cases with the club stations and the headsets. I have one of the intercoms and John is bringing the other. John is also bringing the club antenna analyzer.

4. I am going to bring my FT-450 setup with a computer for use on six meters and CW. We can use six in addition to the other two primary rigs and six will likely be open this year. I will do some CW when one of the primary rigs is not manned. But with emphasis on allowing maximum use of the SSB rigs.

5. Importantly, we need at least two more laptops for the primary stations. Any available? I will bring the software on a USB stick.

6. The Bell County trailer needs some maintenance and will not be available this year. So we will be set up under the pavilion as usual, so if you have a fan bring it.

7. For those going to the container, let's meet there at 8:30 with plans to start the setup at the field day site at 9AM. I don't have a key to the container so we will need Myron's or Gerald's. Then I hope we have lots of help at the field day site.

I am also posting this to the reflector to remind folks "We need help". Especially Saturday morning at 9 for setup and Sunday around 9 for tear down. There should also be lots of time available for operation on HF SSB.

Subject: New laptop and winlink emaill address

Friday 2012-06-22 13:36:42

I HAVE had to get backinto the laptop business due to my DEC requirements(I
can not survive without PowerPoint).

I have loaded up Winlink Express and made a connection; this message is to
get some contacts over to the laptop.

Please add w5bec@... to your contacts.

I will probably install the new (to us)Pactor modem on the laptop/IC-7200 so
that we will have a portable platform if needed. In anticipation of this I
used the Bell County EOC call, W5BEC, instead of mine (I am the trustee).

I will try to have this setup for a Winlink Demo at the Temple ARC field day
site on one of the following frequencies for peer-to-peer contacts...

[Joe Dorn, W5VEX] UPDATE;
WE ARE PLANNING ON TWO HF WINMORE STATIONS AT THE TARC FD... THE SECOND
STATION IS KE5ISN...

(The following is the p2p frequencis used on 5 May...)

Center Frequencies

7090.0 (preferred)
7081.5
7076.5

p@p call sign 'W5BEC'

I will also check WinMor/WL2K periodically for other contact possibilities...

I apoligise for the lateness of this message in relation to Field Day but I have just got the laptop/WLE loaded and working.

Darwin,

Really sorry I missed Field Day this year. Just had too much on the dance card. I will go in for my 6th back surgery tomorrow am and another one again next Monday week. Will be home recovering after that. First few days will be in hospital. Still need to work on hooking up amp at the house.

Also, I've re-enrolled in school and will be working on completing my Doctorate in Psychology so radio time will take a hit as a result.

Later,

5396. 4th of July Parade

Yahoo group: Temple_ARC
Date: 2012-06-27 22:25:34 UTC
From: Michael LeFan
Topic: 1393 Message: 5396

We need Hams to volunteer for the 4th of July Parade in Belton. With talkie or without, you are needed for helping line up parade entries. It’ll be hot, but it’s a great time. Be part of it. Contact Robert Shoemaker, KE5WVC, Myron Mesecke, N5TFK, or any TARC officer ASAP. Thanks and 73 – and enjoy a safe and happy Independence Day!

5397. 4th of July Parade

Yahoo group: Temple_ARC
Date: 2012-07-03 13:17:17 UTC
From: Darwin Geiselbrecht
Topic: 1393 Message: 5397

Once again, it is nearing time to help line up the entrants in the big July 4th parade tomorrow in Belton. This is a good opportunity to use our communications gear for a good cause.

I know most have helped in years past. For those who are new to the process, this is a communications exercise using hand held transceivers. If you don't have a handi-talkie, come anyway and we will pair you up with someone who does. We will use the Belton repeater on 147.3 with a 123 PL tone. This has always given us excellent coverage. Note that the 123 PL is new for this year. So if you used the repeater last year, check the PL tone before you arrive as it has changed.

We will meet tomorrow, July 4, at 7:45. We will meet at our usual spot in the parking lot that is at the first left off 10th street at the main entrance of Mary Hardin Baylor (MHB) at the corner of 10th and 317. Maps and lists will be available then. The parade line up be slightly different, but not as much as indicated during the last club meeting. As always, the parade will still start at the main entrance to MHB at the corner of 10 and Main. The only difference will be that Crusader Way (the road parallel to the railroad tracks) will be closed for construction. The VIP's will assemble on the usual parking lot. But line up will snake through the college rather than follow Crusader Way. I believe the horses will still unload in the grassy area by the railroad tracks but will then line up back in the campus. The line up on Industrial will be the same as always.

The chamber has promised us golf carts, so if you have a limitation concerning standing or walking, we should be able to get you in a cart.

If you have high visibility safety vests, please bring them. Otherwise, I believe Jake from the Chamber of Commerce will have some available.

We will help with the line up as soon as deployed shortly after 8. The parade will roll at 10.

Of course bring a big hat and long sleeves, no clouds in sight. There should be water available from the Chamber of Commerce. As far as the heat is concerned, we will be complete by about 11AM before the worst part of the day.

Of course we welcome the participation of CTARC members who make a valuable contribution to several of our outings. Please post this to any CTARC reflectors.

Thanks in advance for your help and see you tomorrow. 73 - Darwin K5DOA

5398. Clouds for the parade line up

Yahoo group: Temple_ARC

5399. Private/ Amateur Radio Weather Stations...

Yahoo group: Temple_ARC
Date: 2012-07-03 23:10:49 UTC
From: Joe Dorn, W5VEX
Topic: 5399 Message: 5399

BCC: a bunch

I have almost successfully returned my two weather stations to the air, both physically and radio wise. My horses became tangled up with them while testing them a few years back and I piled them in one of my many corners. I felt the need to return them to service and after over a month of replacing parts and recalibrating the first one is up and twirling; the other is waiting for one more replacement part and should be up by Friday.

Amateur radio has long been associated with weather events and SkyWarn (the reason I returned to amateur radio in 1996 after a long absence.).. One facility many of you might not be aware of is the Citizen Weather Observer Program (CWOP). If you have seen the many weather symbols on one of the APRS display programs such as aprs.fi you have seen CWOP in action, especially those without amateur radio call signs. I was the 53rd member of the now thousands of people contributing to it.

From the web site:

<http://wxqa.com/> http://wxqa.com/

The Citizen Weather Observer Program (CWOP) is a public-private partnership with three main goals: 1) to collect weather data contributed by citizens; 2) to make these data available for weather services and homeland security; and 3) to provide feedback to the data contributors so that they have the tools to check and improve their data quality. In fact, the web address, wxqa.com, stands for weather quality assurance.

Those of us that have our stations in the program have the data quality checked and thus we are putting out quality information. For more information, visit the web site. I am reentering the weather stations into the program and within a week the data should be qualified.

Robert Shoemaker, KE5WVC allowed me to place one of my Peet Brothers U2100 units at his house located on a point overlooking Stillhouse Lake in Bell County and it is running under his call KE5WVC-1. The data should be good starting today.

(You can also use my station's call W5VEX-1 but at this time it is on a bench in my shop)

Two easy ways to view the data is furnished by APRS.fi and FindU.

Go to:

www.Aprs.fi and enter KE5WVC-1 in the 'Track Callsign' box

Click on his symbol and then select 'info' and then 'weather' from the screens presented. A lot of other info about the station is available on the screens also.

A more succinct set of screens for the online display is available from our old friend 'FindU' that is not used as much as it once was since aprs.fi made the scene. There is also a lot of APRS information available on the site but for our present purpose go to:

http://www.findu.com/cgi-bin/wxpage.cgi?call=KE5WVC-1

or

http://www.findu.com/cgi-bin/wxpage.cgi?call=W5VEX-1 (later this week)

If you have not done so before, play around with these sites. A lot of information is on either of them.

My next project is probably getting on the air with Pactor III. Standby.

Now time to go to a meeting.

BTW, the northeast is finding out about cell phones and emergency power. Amateur Radio is the first resort after the last resort is gone..

Hello Eula,

I checked at the post office and there was no check.

Makes me wonder if there is a post office box in your area that is no longer picked up. Oh,well you can try again and if we get 2 checks we will return one.

Best wishes.

From: Joe Dorn, W5VEX
Topic: 5406 Message: 5406

Any of you that have heard me speak about Winlink2000 have also heard me state that the dedication of the support group is absolutely outstanding. The ARRL Presidents Award is one of the highest honors the amateur radio community can give to one of its own. Victor Poor, W5SMM, the father of WL2K, was just presented with this honor.

Steve Waterman, K4CJX, who composed the note below, is also deserving of such an award for his support of the system.

I had the honor of shaking hands with both of them in Dayton a couple of years back; I did not wash my hands again in Dayton that year.

5407. Garrett Hill, N5MPE, SK

Yahoo group: Temple_ARC
Date: 2012-07-29 02:34:28 UTC
From: Rocket
Topic: 5407 Message: 5407

Retired Colonel Garrett Hill, 94 of Morgans Point Resort, died Friday July 27, 2012 at his home.

Mr. Hill was born August 6, 1917, in Norman, Oklahoma, the son of Garrett L. Hill and Cordillia (Beard) Hill. He married Muriel (Mic) Klippel, July 18, 1938 in Norman, Oklahoma. He was a graduate of the University of Maryland, University of Mary Hardin Baylor and received his masters from George Washington University.

He retired from the United States Army after 30years, which included serving in World War II and Korea. He was director of Industrial Operations at Ft. Hood when he retired. After the military retired Mr. Hill built a Foundry, spin casting, in Temple. He also was a licensed real estate broker.

He moved to Morgans Point Resort in the mid 1970's. He, along with others worked to see Morgans Point Resort incorporated into a city. He was a city councilman for 12 years.

Mr. Hill was a 32nd degree Mason. He was a long time member of the Temple Lions Club and a member of P. O. S. T of Morgans Point Resort. He was a member of the Old St. Luke's Episcopal Church in Belton.

Mr. Hill was preceded in death by his son Garrett L. Hill III.

Survivors include his wife of 74 years, Muriel (Mic) Hill of Morgans Point Resort and daughter Kay Casey of Petersburg, Virginia, two grandchildren and two great grandchildren.

In lieu of flowers the family requests memorials be made to your local Humane Society.

Dossman Funeral Home of Belton is in charge of arrangements.

5408. David Hobbs, N5WBS - SK

Yahoo group: Temple_ARC
Date: 2012-07-29 02:49:04 UTC
From: Rocket
Topic: 5408 Message: 5408

We lost one other local ham in the last week also..

David Hobbs, N5WBS

He was active with TARC during the early to mid 90's....

David Sidney Hobbs, age 65 of Troy, died Sunday, July 22, 2012 at his residence. Services will be held at 10:00 AM Thursday, July 26, at Scanio-Harper Funeral Home with Rev. Steve Packer officiating. Private family burial will be at Hillcrest Cemetery. Visitation will be 5:00 ☐ 7:00 PM Wednesday at the funeral home.

Mr. Hobbs was born March 20, 1947 in Austin to Elmo and Angeline Srnensky Hobbs. The family moved to Temple in 1950 where David attended Temple High School and graduated from there in 1965. He attended Temple Junior College and the University of Texas at Austin before graduating with a BBA degree from the University of Mary Hardin☐Baylor.

Throughout his high school and college days, he worked as a disc jockey at KTEM-Temple and KVET-Austin. Afterwards he worked for the Texas Alcoholic Beverage Commission as an auditor in Dallas and the Texas Panhandle. In 1972, David returned to Temple to join and manage Temple Color Company, the family business. He did so continuously until July 1, 2012 when English Color & Supply, Inc. of Dallas purchased Temple Color Company after 62 years of business. David continued to manage the store until his death.

David was devoted to his family as a husband, father, "Poppy", brother and uncle. He was preceded in death by his parents. Survivors include his wife, Annelle Hobbs, son Brent Luck and his wife Kris, grandsons Ryan Luck and Alex Luck, and granddaughter Elizabeth Luck; he is also survived by his two brothers, Ken Hobbs and Ken's wife, Melva and Dennis Hobbs and Dennis' wife Lisa; nephews, Chad Hobbs, Brad Hobbs and Justin Hobbs; and nieces, Kristi Hobbs Cleere and Lauren Hobbs and his mother-in-law, Helen Haddock.

David was a member of the First Baptist Church of Temple and also served previously on the Temple Independent School District Board. He was a member of the Knob Creek Masonic Lodge #401, King Solomon Lodge #1427, Temple York Rite Bodies and an endowed member of Waco Scottish Rite Bodies.

In lieu of flowers the family asks that donations be made in David's name to your favorite children's charity.

Pallbearers are Al Brockett, Jack Compton, Steve Haddock, Brad Hobbs, Mike Kerlin, Robert Paulk, Gene Sosa and Vince Thompson.

The family wishes to acknowledge with deep appreciation the many expressions of love, concern and kindness shown to them during this time. May God bless and keep you.

Joe,

Hope you and some of the Bell county people can make this one...We will be using our 30 ft. completely equiped Flying Dutchman trailer which has everything in ham field....we even have two tin cans and some string ahahah. These drills are being scheduled for once a month and can be anywhere including Bell county. We will be moving them all around throughout the year.

Emergency Drill

11 AUGUST 2012

Update: 08/06/2012 The TSGARC Communications Trailer will be pressed into action on this drill !

The TSGARC is sponsoring an emergency drill that will involve all of our area hams who wish to participate. The emergency, like many emergencies will not be known until it actually happens. ...So goes this drill.

We plan to announce and emergency on the 147.32 at about 9:00am on Saturday the 11th. The type of emergency will be announced on the repeater with an appeal for local help from any HAM operator in the area of the emergency to report somewhere to assist. We will then assemble at some location which is in the affected area and plan to help solve the situation. We expect the event will only last a couple of hours and plan to assemble for lunch and debriefing at an unknown location. Why do we say "unknown".... and that is because, as any emergency, no one knows until it happens. That will be the theme of this exercise. This should be fun as well and we plan it to be both educational and fun.

Hope as many of you as possible will participate and be sure and include the family...we have no idea what type this will be but we will decide as a group what to do to solve the problem...all of your input and ideas will be welcome.

We might be thinking of having some "foxhunt" gear available in case we need to follow radio signals...(just a hint)

More to follow...

Leon

BCC Usual lists. Rick: do your forward.

I apologize for not getting this out sooner. I have been having computer problems and also setting up new ones. For the first time in several years I have my 'weather central' working; two computers, four screens and two Peet Brothers weather stations twisting and twirling. Now all we need is some rain. If you wish to check in on the weather stations, one is at my house just west of Belton and the other is overlooking Stillhouse Hollow Lake at Robert Shoemaker's house.

Emergency Drill

11 AUGUST 2012

UPDATE 08 AUGUST 2012

1-There will be a transmission from 8-10 am asking for assistance at a specified location

2-The frequencies for this message will be:

a-147.320 123

b-147.180 123

c-146.780 123

3-After the announcement and request for assistance,you will be asked to check in to the Net Control at the Command Post. The controller will direct everyone to go to the TACTICAL FREQ. OF 146.780

and the other frequencies will then be monitored by CP for traffic as well.

4-The FTX will then proceed on 146.780. Those that can monitor the tactical freq. will be given continuous information and updates. Those updates will also be transmitted on 147.320 and 147.180.

5-When the decision to execute is relayed to the command post, everyone will be updated and will be directed to 147.550 simplex. We anticipate that fox hunt equipment will be working that freq. and we ask that those not engaged in the search monitor only on this freq.

This is a family event involving hams from Central Texas. This is not a club event and is merely sponsored by the TSGARC so everyone is invited whether you are a ham or not....bring Mom, Dad the kids, the dog, the cat and anyone else that you think might enjoy a fun morning.

We are providing lunch so bring your appetite as well. We would also suggest lawn chairs for comfort for those not involved in the exercise. Please email Carolyn, kd5glm16@... with the approx. number of folks that will be attending. If you forget...not to worry..will have plenty to eat. We will also have tea and water so if you want soft drinks, please be sure and provide those.

THIS WILL NOT ONLY BE AN IMPORTANT TEST OF OUR CAPABILITIES...IT WILL BE FAMILY FUN!!!

The TSGARC is sponsoring an emergency drill that will involve all of our area hams who wish to participate. The emergency, like many emergencies will not be known until it actually happens. ...So goes this drill.

From: Joe Dorn, W5VEX
Topic: 5413 Message: 5413

I was getting ready for the TSG exercise this morning and could not find my H/T, a Yaesu VX8 and its zip-lock bag of accessories. Since I have not needed it recently I have no idea when I last saw it. I have had it with my WinLink demo stuff and thus the most likely places I would have lost it are at the TARC Field day, or, most likely the Clifton VFD. There is also a possibility of the Whitney VFD. If anyone can check the two VFD's I would appreciate it.

BCC: my ham lists

Rick: forward to CTARC and fell free to edit for the newsletter

The Waco TSG sponsored a search and rescue SET (Simulated Emergency Training) yesterday that was very successful and might be a model for some other amateur radio clubs with an interest in emergency response.

Three of us from the Central Texas Amateur Radio Club, Teddy, KE5UET, Priscilla, KE5UES, and me, W5VEX, met at the Bell County EOC and headed toward Waco for the event. We are not at all familiar with the area so we chose to head to the TSG clubhouse and follow the communications trailer. We did, for about five miles then the trailer developed a flat (real, not simulated). We had some basic instructions on where to meet the rest of the crew and after about an hour of checking out Hill County we found the base of operations.

We were assigned an initial location in the large city of Vaughn (look it up). We did not have a directional antenna and were forced to use the directional characteristics of the Yaesu FT60 H/T. We were able to get a fairly good direction when the ☐lost☐ station transmitted. Five stations reported their location and directional results and then we were reassigned another location based on our observations. I then proceeded to get lost and asked for directions again. We were told to go down a graveled, wash-board road somewhere in the vicinity of Lake Aquila (near the aforementioned city of Vaughn). I could not find a wide spot to pull over on until we located a Corps of Engineers parking area.

We jumped out and got the trusty FT60 ready for the next transmission. The transmission occurred and we had full scale with 360 degree reception Teddy then noticed a cardboard sign on the far fence that said ☐blue truck for the armadillo hunters☐. We had lucked into the location we were searching for. Then the real search began, our group did an initial search for the victim with no results. The rest of the crew arrived with much younger legs and started the woodlands search. After about an hour the victim was back in the parking area. He had well hidden himself about a mile from the parking area.

We then relocated back to the base for ☐solar cooked☐ hotdogs, chili and other fixins☐.

We had a fun time and overall the event was a great success with some real situations that were not planned. Every one was ready to do it again and that will be in September at some unannounced location. Hope to see you there. This was a great way to ☐play radio☐.

Thanks Leon and the Texas State Guard Club for your efforts

I expect CTARC will be having a directional antenna building session in the near future

Leon□s more formal report and the event□s initial directions are below .

Subject: Field Training special event REPORT Congrats to ALL

REPORT: Field Training Search and Rescue update and result!!

Thanks to all of you who participated in making this a meaningful and uplifting event. Here is the re-cap: The search team successfully located our victim and his Armadillo in less than 3 hours by using all of our tools; radio, DF gear, map reading, search methods, observation and plain intestinal fortitude. All of you represent the very heart of being the epitome of volunteerism...responding to a call for help regardless of the danger.

Shortly after the emergency drill was activated, David, KC5UOZ and his crew who were in charge of the mobilization, reported the TSGARC 30 Ft. Communications trailer had blown a tire while enroute to the command post. Bud, AD5SK, TSGARC net controller determined mobile communications would not reach distant stations. Without hesitation, HOTARC member, Jim Judd KA5QKL, volunteered to handle the net control position as long as necessary. Jim, whose station was 30 miles south of the search area, had no operational information so had to do what we all do during emergencies; □wing it□

Ham radio operators who were enroute to the drill from BCARC, LWARS, CTARC, HOTARC, and TSGARC spotted the broken down trailer and assisted in getting it to the Command area safely.

The rest of the radio operators from the above clubs proceeded to the location where strong signals from Marty, KF5IXZ were detected. This was the east side of Lake Aquilla in Hill County.

A briefing took place at the search site and BCARC member Mark Allen W6PC volunteered to lead the mission. After a short briefing, Mark set up a

search plan using ☐fox hunt☐ equipment. He and the search teams then proceeded to the search area working communications between Jim, the teams, and our temporary command post on Lake Aquilla. After approximately 3 hours of intense searching and planning the teams narrowed the target to the area where Marty☐s signal was strong.

He was rescued, and returned to the staging area where he and fellow hams had a nice lunch prepared by Carolyn, KD5GLM.

The Armadillo, who was found confused and disoriented, was captured. A mug shot is attached.

TSGARC

UPDATE 11 AUGUST 2012 0330HRS

IT IS OFFICIAL...WE ARE INITIATING A SEARCH AND RESCUE MISSION:

Marty has not contacted his wife and presumed injured or lost. Please follow the emergency protocol listed on this memo. If you have □fox hunt□ equipment, it will definitely assist in this mission. We intend to have the TSGARC communications trailer in an area we think might be central to the search.

Any HAM or friend is welcome to assist in this mission; we have non-ham communication equipment available for those that fall in that category. Everyone with any expertise is welcome Including the dog, cat , mom, dad, brother, sister and Marty□s pet worm. Marty may also have a rare Armadillo in the area that also needs attention who could be in labor...those of you who are EMT trained might keep this in mind, in that the capture of this rare animal is also part of the mission. In other words...if you have a choice...well we□ll let y□all make that choice. But in all fairness...the Armadillo doesn□t weigh much...

We have found in our many years of performing these rescue attempts, that time is on our side so with that in mind, try and be there around 10:00am.

This gives the couple and us more time together...more precise expertise in the search. The Command Post will not exist before 10:00am and hence no goodies until we get there. The radio frequencies will be monitored beginning at 0800.

Susan also told me confidentially, that Marty has an □Armadillo Fixation□ thing and always brings his manual with him for those quiet moments and therefore may be quite docile when approached.

ANTICIPATED SEARCH AREA

Here is the general area we intend to search in order of Priority:

1-Lake Aquilla: map areas would be close to the intersection of FM933 and FM1534 near the bridge over the Lake...Whitney has several nice breakfast facilities also in the event Marty is not a priority

GPS : 31 30.48 29 N

97 18.04 82 W

2-Lake Whitney: Map areas would be close to Hwy 22 and FM56 in the downtown metropolis of Laguna Park.. Watch for heavy traffic... And the Bosque Resort and Café has a neat breakfast in case you are not in a hurry

GPS: 32 52 155 N

97 23 659 W

PLEASE LISTEN ON ANY OF THE FREQUENCIES LISTED BELOW ON THE OPERATIONS PLAN FOR INSTRUCTIONS. CHECK IN BY GIVING YOUR STATION, CALL SIGN AND LOCATION TO NET CONTROL AND PROCEED TO THE STAGING AREA. AGAIN THANK YOU ALL FOR YOUR HELP IN LOCATING A FELLOW HAM AND HIS □SIDEKICK□...PERSONALLY, I AM GOING TO POP A COLD MILLER LITE AND THINK ABOUT ALL THIS...

SERIOUSLY...HOPE TO SEE YOU ALL THERE AND LET□S REALLY GET THIS STUFF DOWN...WE ALL KNOW IT WILL REALLY HAPPEN ONE DAY TO ANY OF US!!

Leon

Subject: What’s Up In North Texas

- SELF RELIANCE EXPO
- RAPID DEPLOY COMMUNICATIONS ASSISTANCE GROUP
- HAMFESTS and EVENTS
- LICENSING EXAM ROUNDUP

** SELF RELIANCE EXPO

The North Texas Section had a booth at the Self Reliance Expo held on July 27 and 28 at the Arlington Convention Center. Hams and non-hams alike visited the booth. Section Manager Walt Mayfield, KE5SOO, Matt Mayfield, KF5HHL, Chris Hillis, K5CMH, Stacy Rogers, KK5SAR, and Jim Pope, N5JCP answered questions posed by the numerous visitors.

** RAPID DEPLOY COMMUNICATIONS ASSISTANCE GROUP

The Rapid Deploy Communications Assistance Group is looking to add additional group members. This section level response group is made up of highly motivated and skilled public service minded amateurs from across the North Texas Section.

The group can deploy for State, Section or District events as needed or requested. This group is proficient with VHF and HF digital and voice communications. If you are interested in joining the RDCAG you can find more information on our web page at: http://tinyurl.com/RDCAG
If you have additional questions contact John Galvin, SEC, at n5tim@....

** HAMFESTS
There are several Hamfests and other events scheduled for the remainder of 2012 and early 2013. Please see the following and join in on the fun.

Gainesville Hamfest

The Cooke County Texas Gainesville 2012 Hamfest will be held Saturday, August 25. Flea Market Set-up, Friday 5:00 p.m. to 8:00 p.m., Saturday 6:00 a.m. to 7:00 a.m. The Gainesville Hamfest Flea Market will take place inside the air-conditioned Gainesville Civic Center. Tailgate space is outside. Please get your table request in early as a sellout is expected.

For more information please contact James K. Floyd, N5ZPU (940) 668-7511 jfloyd54@... http://www.gainesvillehamfest.org .

HamEXPO! 2012

The Temple Amateur Radio Club will have HamEXPO 2012 on Saturday, October 6, 2012 from 7:00 AM to 2:00 PM (CDT) at Belton, TEXAS 76513.

Please see http://www.tarc.org/hamexpo/ for more information.

NCTECH 2012

North Central Texas Emergency Communicators' Ham-festival will be held on November 10, 2012, 8:00 AM to NOON at the Azle Community Center, 404 W. Main Street, Azle, TX 76020
http://www.wc5c.org
Contact Paul Finch via email: azlecomm@...
NCTECH is hosted and sponsored by Tri-County Amateur Radio Club WC5C, and is always the second Saturday in November. One of the features of the hamfest is the Swap Meet area, a veritable Ham Radio and High Tech flea market, with new and used Amateur Radio bargains. Indoor tables are $10 each (paid in advance, $13 at the door). Outdoor flea market space is free. Presentations are made by Disaster and Emergency Communications organizations and by Ham Radio clubs and experts. Sign up early to make your presentation!
A W5YI and/or ARRL Volunteer Examiner Exam Session will start at 9am. Bring your photo ID, pencil and non-programmable calculator.
For Amateur Radio clubs and for Disaster Relief agencies wishing to set up a non-sales table to display information about your organization and achievements, or to conduct volunteer and membership drives, Indoor Tables are Free (limit 1 per organization)!

COWTOWN HAMFEST

The Lockheed Martin Amateur Radio Club is sponsoring THE COWTOWN HAMFEST 2013 AND ARRL NORTH TEXAS SECTION CONVENTION . The event will be held January 18-19 at the LOCKHEED MARTIN RECREATION AREA, 3400 BRYANT IRVIN ROAD, FORT WORTH,
TEXAS 76109 FORT WORTH, TEXAS 76109
Plan ahead to attend this great convention. Please click the following for more information: http://www.cowtownhamfest.com

MENSA AMATEUR RADIO SPECIAL INTEREST GROUP, HAMSIG

The International and American Mensa Amateur Radio Special Interest Group, HAMSIG, will be holding the M2013 Annual Gathering (national

convention) in Fort Worth from July 3rd until the 7th, 2013.

A Special Events Station, N5M will operate during the convention.

Right now, HAMSIG has 206 members, and is actively looking for more members to join in on the fun. If any members of your clubs are interested, please have them check out the Mensa website, www.ag.us.mensa.org, for more information.

Bill Munsil, K!ATV, the moderator of the Mensa Annual Gathering, can be reached at wmunsil@....

** TARRANT COUNTY RACES AMATEUR RADIO LICENSING CLASS

Tarrant County RACES will be holding a Amateur Radio licensing class August 22 and 23. This 2-day class is for anyone who wants to get their amateur license giving them the ability to communicate on the ham radio frequencies during emergencies.
The class will run from 9am to 3:30pm both days. This is a very fast paced class and will cover all the material in the Gordon West Technician class study guide. Our passing rate is at 99.5% on the first try, so you know you will be able to pass the FCC mandated license exam on Friday afternoon. (Just ask some of our previous students who thought they could not do it.)
The $35.00 fee includes the Gordon West study guide and the FCC mandated exam fee of $14.00. We can only accept cash for this fee. To be able to get the materials in hand, please RSVP as soon as possible. Fees will be collected on the first day.
If you are interested, or have questions about the class, please send an email to Gerry Dalton, RACES Liaison at gerry.dalton@.... Also, please e-mail for the location confirmation.
(Please forward to any other mailing list where this class would be of interest)
Gerry Dalton - W5MAY City of Fort Worth Fire Department Office of Emergency Management RACES Liaison Officer Cell: (214) 532-1905 Email: gerry.dalton@fortworthtexas.gov

** Updates and Corrections:

Please email Jim at N5JCP@... if you would like to have your club / organization special event highlighted in upcoming newsletters.

Subject: Re: [BLT] BLT31 writeup

BLT Team,

Check out the data from Thomas!

We had a few glitches with W5ACM-9 tonight, but they appear to have been cured by a strategically-located RF choke. We are good to go for launch at 10 AM. ALL of the payloads are working great.

At this time we do not have access to a hanger, so we will hope to get one in the morning, or just gas up on the downwind side of one of the large hangers, perhaps near the office.

Check the overall payload specs at http://www.w5acm.net/b31.html

To the Spaceport!

Andy W5ACM

5418. FW: NWS UPDATE: Severe Potential and Locally Heavy Rainfall

Yahoo group: Temple_ARC
Date: 2012-08-18 18:58:35 UTC
From: Joe Dorn, W5VEX
Topic: 5418 Message: 5418

We finally received a significant rain just west of Belton, 0.8 inches and still getting a light rain. Maybe the weather pattern is changing. El Nino is building again which is good for our possibility for a wet winter.

At any rate here is the latest from the Fort Worth forecasters.

Subject: NWS UPDATE: Severe Potential and Locally Heavy Rainfall

Good afternoon everyone,

A complicated forecast today and tonight, but the bottom line is there remains a risk of severe weather this afternoon and tonight. There is also the possibility of localized heavy rainfall if things pan out like they could. An image has been included to show the relative rainfall amounts today and tonight.

Overview

A moist and somewhat unstable air mass in in place across northern and central Texas once again today. A complex of thunderstorms is occurring across Oklahoma, with some additional development on the west side of the complex. Scattered thunderstorms will continue for the rest of the afternoon. North of I-20 and west of I-35/35E, there will be the potential for organized storms to develop during the late afternoon or early evening hours. By the overnight hours, the complex over Oklahoma will reach the Red River and will affect northern and central Texas in the evening hours and overnight. These storms will likely not move fast, and will be capable of producing localized areas of heavy rainfall. Despite the recent dryness, there should be enough rainfall potential for patches of flooding or flash flooding. The severe potential will mainly be in the form of large hail, similar to the reports of ping pong ball hail we saw yesterday. As it is August, there will also be the potential for strong downburst winds in the thunderstorms, especially across the NW quarter of north Texas.

IMPACTS / AREAS

Due to the complex interactions of this forecast, the impacts are determined mainly by area:

NW (north of I-20 and west of I-35/35E) - highest potential for severe thunderstorms including large hail and damaging winds. Localized flooding/flash flooding possible

NE (north of I-20 and east of I35/35E) - lesser potential for severe thunderstorms, including large hail and damaging winds. Highest rainfall amounts will be in this area.

SW (south of I-20 and west of I-35/35E) - small possibility of severe thunderstorms, including small hail and damaging winds. Localized flooding or flash flooding possible.

SE (south of I-20 and east of I35/35E) - lowest possibility of severe thunderstorms, some small hail and strong winds possible. Localized flooding or flash flooding possible.

TIMING

There are several areas of thunderstorms across north Texas now, but additional development, including the highest potential for severe weather will occur after 3 PM. Heavy rainfall potential will continue during the overnight hours, before the system moves southeast on Sunday morning and afternoon.

FORECAST CONFIDENCE

Forecast confidence is high for the occurrence of thunderstorms Confidence is moderate about the potential (and area) of strong to severe thunderstorms. Forecast confidence is low, but increasing, about the potential for localized heavy rainfall. Confidence is too low about specific areas to include a flash flood watch at this time. However, either Flash Flood Warnings or Urban and Small Stream Advisories will likely be issued for areas of northern or central Texas tonight, before the upper level system moves to the southeast.

BOTTOM LINE

Strong to severe thunderstorms are anticipated this afternoon, tonight and early Sunday morning. Overnight rainfall could easily produce localized flooding in traditional low lying areas and/or near ongoing construction. Spotter groups, especially north of Interstate 20 should be prepared for activation tonight. Emergency Management, elected officials, and transportation officials should be prepared for the possibility of a few severe thunderstorms and the potential for localized heavy rainfall.

DEC's,

I would encourage you and your EC's and their groups to check into the Texas ARES Monday night net tonight at 19:30 hours on 3873 if able. This net should provide the latest info from the Texas perspective. This is a weekly net and NTX is taken first. It would be great for NTX to increase its participation in this net.

From: Mark Fox [mailto:mark.fox@...]
Sent: Monday, August 27, 2012 3:14 PM
To: Mark Fox
Subject: NWS UPDATE: TS Isaac

Good afternoon everyone,

Attached is a brief update on TS Isaac. At the current track, Isaac is not expected to produce much in the way of direct impacts. There already is a chance of showers and thunderstorms across the area, which some of us are seeing this afternoon.

The latest forecast track of Isaac will likely stay similar to the one in the PDF, although we wouldn't be surprised to see the track move slightly to the west with subsequent advisories. (As usual, continue to monitor the NHC forecast tracks) The bulk of the heavy rainfall will stay well away from northern and/or central Texas, and most of the heavy rain will remain across central or eastern Louisiana.

Isaac is over open waters and has come across a much more favorable environment in the past 12 hours or so. The storm will continue to increase in strength, and is forecast to become a Category 1 storm before landfall. The storm will also lose some forward momentum before hitting the Gulf Coast, so extremely heavy rainfall and flooding will become a huge impact for neighboring states.

Bottom Line:

Isaac will be big impact on Louisiana and Mississippi. The storm will have minimal impacts for north Texas directly. Monitor NHC forecasts for the up to the minute forecast track and intensity forecasts.

Any questions, please do not hesitate to ask.

Mark

To: ntxares@yahoogroups.com
Subject: [ntxares] Change in Plans for Tonight's ARES net

All,

Our counterparts in LA will be on 3873 tonight dealing with Isaac. Rather than move our net to another frequency, I suggest monitoring their net on 3873 instead. LA runs a crisp operation and this will be better training than we could get otherwise and will keep more bandwidth available to other possible emergency nets on 75M from other gulf coast states.

Please give them a clear frequency and don't check in unless necessary.

Thanks, John - N5TIM

Subject: [TARC] 2012 Christmas Party for members and guests

As of today I am taking the $5 reservations from TARC members for the 2012 Christmas Party. Same time same place. 1st Thursday in December a the Wildflower in Temple, TX. Guests of members also $5 per person.

I prefer that everyone try to send a check to P.O Box 616, Temple, TX 76503 for your reservations, or pay at either the October or November meeting. Please take a receipt for any cash, or use your check copy as a receipt. We need to get as close a "count" of dinners prior to the event as possible. The club pays the additional costs for the dinners beyond the $5. On the comments of checks please put your HAM call sign and write "dinner" next to it.

I have learned from experience that many people like to pay for their next year's membership when they pay for the dinner. If you wish to do so then write 2013 membership on a seperate check please.

THANKS !

See you at the next meeting.

1st Thursday every month at 7PM.

To: Mark Fox
Subject: NWS Update: Friday Night Rainfall / Thunderstorms

Good afternoon everyone,

Rainfall will be increasing into the weekend, but is expected to be heaviest overnight tonight and early Saturday. An image has been included to depict the anticipated average rainfall amounts.

Overview

The remnants of the Pacific Hurricane Miriam are moving across the state of Texas, and is adding to an increasingly moist air mass. There are showers and thunderstorms occurring to the west of I-35/I-35W this afternoon, with an isolated shower to the east. As the evening wears on, the rainfall shield will increase in coverage and intensity for most of the area. Heaviest rainfall is expected to be south of Interstate 20, with the heaviest of all activity in the southern and southwestern areas of northern and central Texas. Average rainfall amounts will be between 1 and 3 inches (see graphic) but isolated areas could see localized flooding issues. Across Texas, the heaviest rainfall is anticipated to be near Midland (where flooding has been ongoing) and in the Hill Country. See WFO Midland or WFO Austin/San Antonio

for their specific forecasts.

For north Texas, there will be an increasing chance of rain, and a scattered to numerous thunderstorms.

IMPACTS / AREAS

All of north Texas will see the chance for thunderstorms. Greatest chance for localized flooding will occur near the areas of heaviest rainfall. The biggest impacts from these storms will be from dangerous cloud to ground lightning, which will be associated in any thunderstorm. The usual Friday night outdoor activities will see a threat for lightning through the early evening hours.

TIMING

From now through 8 PM, there will be a chance for thunderstorms and lightning. After that, the chance for lightning does not go away, but will lessen a bit once the sun sets. Additional heavy rainfall is possible during the overnight hours, before the rainfall begins to diminish from north to south during the morning hours on Saturday.

FORECAST CONFIDENCE

Forecast confidence is moderate. There will be rain and thunderstorms, but the confidence is low for any one spot for the lightning occurrence and for the specific areas of heavy rainfall. Traditional low-lying areas, construction zones, and areas that usually flood are all areas to be monitored closely until the end of the rainfall.

BOTTOM LINE

A lot of outdoor activities are going on today, tonight, and through the weekend. Lightning will be a threat for any of these outdoor events, so the radar will need to be monitored closely for any outdoor activities. Please continue to monitor National Weather Service outlooks, forecasts, and graphics for further refinement of the areas to be affected. Once the lightning threat diminishes late tonight, there will be the potential for heavy rainfall during the overnight and early morning hours of Friday night/Saturday morning.

As always, here are some useful websites...

5433. FW: 5 PM 9/28 Update (no major changes) - Heavy Rain Event Late This evening Friday into Saturday

Yahoo group: Temple_ARC
Date: 2012-09-29 01:12:25 UTC
From: Joe Dorn, W5VEX
Topic: 5433 Message: 5433
Attachments: 2 described; binary payloads are missing from this source WARC

This is the San Antonio/Austin take on the upcoming event. Both FWD and EWX are calling for very significant rains for our area but when this event is coming from the southwest thus I pay a lot more attention to EWX. We are closer to their population center and thus I find the Georgetown forecast to be more accurate than the Belton forecast.

Georgetown.

Subject: 5 PM 9/28 Update (no major changes) - Heavy Rain Event Late This evening Friday into Saturday

South Central Texas Partners...

Headline....Heavy rain is expected to fall through Saturday evening. Widespread rains of 2 to 4 inches are possible, with isolated totals of 6 to 8+ inches. Flash Flooding is possible and a Flash Flood Watch is in effect through Saturday evening. The greatest flooding threat will be the 24 hr period from this evening evening through Saturday evening.

Discussion...We continue to forecast a heavy rain event for the next 36 hours. Large amounts of moisture coming from the Gulf and from the remnants of Pacific storms Miriam and now Tropical Storm Norman, will help to produce widespread rainfall, some of it very heavy through Saturday evening. An upper level storm system will provide an additional lift needed to trigger the rain, showers, and thunderstorms.

We have already seen some scattered rains and thunderstorms over the past 24 hours...some producing 1-2 inches of rain, and even some hail and wind

damage out by Lake Amistad in Del Rio TX. Current radar at 5 pm shows a lot of activity across the region. For the rest of this afternoon...expect widespread shower and thunderstorm activity over the far west near the Rio Grande...with scattered showers and thunderstorms developing elsewhere and moving generally north and northeast . Locally heavy rainfall is possible and severe weather should be very isolated. The biggest threat is the heavy rain and flash flooding. Del Rio has already set a daily rainfall record near 2 inches.

The rainfall will become widespread across all the area later tonight and into early Saturday. Saturday looks to be a washout for just about everybody with rain totals looking like 2 to 4 inches across most areas...isolated totals of 6 to 8 inches. I cant rule out an 8+ inch bulls-eye. There is no way to tell where exactly the max rainfall "bull-eyes" will occur....but where they occur will likely cause some big problems. With all this extra moisture coming in off the Pacific, any storm that does form will likely have very heavy rainfall and some minor flooding concerns. A Flash Flood Watch has been issued through Saturday evening. The areas most vulnerable to this flash flood threat are the urban areas, typical flood locations, and areas of the Hill Country. There is a very good likelihood that Flash Flood warnings will be issued in the next 24 hours.

The bulk of the heavy rains will be pushing east late Saturday night into Sunday. The flood threat may still be ongoing and lingering on Sunday in some spots, depending on rain totals and locations of the heaviest rains...but most areas will see improvements on Sunday. Larger creeks and rivers may be in flood, so areas downstream may have to deal with rising water...maybe into next week. This should be watched closely.

Make sure you keep up with the weather this weekend and check our website for the latest forecasts, watches/warnings/advisories and graphics at.... www.srh.noaa.gov/ewx

I have attached the latest graphics including some Flash flood safety tips. Stay safe this weekend. Promote Turn Around Dont Drown and encourage people to stay home, stay off the roads, and avoid low water crossings. This will stand to be the last update as the event is now ongoing. If I see something that indicates we are headed into something else (meaning a really bad situation)...will send out a quick and short notice.

5434. VE's for the Test session at the Ham Expo this coming Saturd ay

Yahoo group: Temple_ARC
Date: 2012-09-30 20:50:09 UTC
From: Joe Dorn, W5VEX
Topic: 5434 Message: 5434

BCC my lists

I apologize for this being so late. I have been in and out of the bed with a severe sinus attack for the last three weeks and not worth much when I was out of bed.

At any rate I need VE's for the Test session at the Ham Expo this coming Saturday. The test will be at the adjacent building (second floor of the 'Dome') with set up starting at 09:00. We should be through by 11:00. As usual, show your VE badges and get into the Hamfest free. The VE's are also invited to the appreciation breakfast the following Saturday.

Please respond to this note if you will be there.

Also I would like someone to take over the responsibilities of the VE tests in the area. You must have an Extra License and be a registered ARRL VE in order to give all of the test levels..

This sinus episode reminded me I am out of the spring chicken category and need to get someone younger to take the job. It is not extremely time consuming, a minor test session takes about two hours, the large sessions about six to eight hours including the session and getting the papers ready to send in.

I will, of course, assist anyone willing to take on the job. You must have an Extra License and be a registered ARRL VE in order to give all of the test levels..

Subject: Live Broadcast of MFJ 40th Anniversary Celebration

It's time for the Live Broadcast <http://w5kub.com> of MFJ 40th Anniversary Celebration!!

MFJ Enterprises will be celebrating their 40th anniversary October 5th and 6th (Friday and Saturday) in Starkville, Mississippi! For those that can attend in person, there will be door prizes (must be present to win), free factory tours (MFJ, Ameritron, Cushcraft, Hy-Gain, Mirage, Vectronics, and MFJ Metal Shop), free lunch, free tailgating, free forums/discussions, and FCC license exams. Special guests will include:

Martin F Jue, K5FLU, president and founder of MFJ Enterprises Inc
Malcolm Keown, W5XX, ARRL Mississippi Section Manager
Harold Kramer, WJ1B, CEO American Radio Relay League
Chip Margelli, K7JA, CQ Communications, Director of Advertising Sales and Marketing
Janet Margelli, KL7MF, Ham Radio Outlet, Anaheim Manager
Ray Novak, N9JA, Icom America, Division Manager - Amateur & Receiver Products
Ted Randall, WB8PUM, QSO Shortwave Radio Host
Dick Ross, K2MGA, CQ Magazine Publisher
George Thomas, W5JDX, Ham Nation, AmateurLogic.com

For additional information regarding the MFJ 40th Anniversary Celebration go to http://www.mfjenterprises.com/dayinpark.php.

If you cannot attend in person, please join the live, online broadcast of MFJ 40th Anniversary Celebration events at http://W5KUB.com where the fun begins!

MFJ 40th Anniversary Celebration broadcast hours:

* Thursday, October 4: 2000 UTC (3:00 PM CT) drive from Memphis, Tennessee to Starkville, Mississippi (approximately 3 1/4 hour drive)
* Friday, October 5: 1300 - 21:30 UTC (8:00 AM - 4:30 PM CT)
* Saturday, October 6: 1300 UTC - 1900 UTC (8:00 AM - 2:00 PM CT)
* Saturday, October 6: 2000 UTC (3:00 PM CT) drive from Starkville, Mississippi to Memphis, Tennessee (approximately 3 1/4 hour drive)

You could be the winner of an online MFJ prize (not to be confused with the MFJ door prizes) which will be awarded during the W5KUB broadcast. Of course, no purchase is necessary to win a prize. W5KUB is not affiliated with any products or companies and does not sell any products or services.

During the live broadcast, you will also have the opportunity to meet and chat with other amateur radio operators from all over the world. The 2012 Dayton Hamvention broadcast had 47,400 viewers!

Please join our group on Facebook at https://www.facebook.com/groups/w5kub/ to keep up with us year-round.

Also, please help spread the word by posting this announcement in Facebook and forwarding this message to your ham radio friends that may not have received this message!

We'll 'see' you at MFJ!

5442. 2012 NCTECH Hamfest in Azle, Texas November 10th!!!

Yahoo group: Temple_ARC
Date: 2012-11-05 18:40:38 UTC
From: WB5IDM@azlecomm.com
Topic: 5442 Message: 5442

Hello All,

Just thought I would remind everyone about the NCTECH Hamfest coming up November 10th at 404 Main Street in Azle, Texas. It's a very good location and easy to find on the Western end of Azle Main Street. The Hamfest will open at 7:00 AM and is over at Noon. Free Tailgating, Door prizes, seminars, VE Testing and more!

If you would like to set up your table(s) Friday evening we will be open from 5:00 PM until everyone is finished setting up their booths. If you would like to set up Saturday morning you can get there at 6:00 AM. There will be security provided by WC5C Friday night.

Tables are $10.00 at the door and there is a coffee shop that has great coffee and breakfast/lunch menus right on site!

If you are coming from the Weatherford area come North on FM 730 to Azle Main Street, turn right at the four-way stop sign and go about 1/4 mile to 404 Main, it's on the left.

If coming from Fort Worth on Hwy 199 take Main Street/Stewart Street exit and turn left off the access road on Spur overpass over 199 to Main Street If you miss the Spur (easy to do) go about one block to the traffic light at Stewart Street and turn left, go past Arby's and El Paseo on right to the light at Main Street and turn right. 404 Main is about 3/4 mile west on right.

From Springtown on 199 take the Azle Main Street/FM 730 South exit, go through the 4 way stop sign and 404 Main is on the left about 1/4 mile.

If coming from Decatur on FM 730 North come South to Hwy 199, turn right on access road and go to the 4 way stop sign and turn on FM 730 South, go to next 4 way stop sign and turn left on Main Street and 404 Main is 1/4 mile on left.

If you need help getting to the location Talk-in will be on the 147.16 repeater, offset +600 KHz and CTCSS of 110.9. Call WC5C for help.

5443. Temple Christmas Parade December 3rd, 2012

Yahoo group: Temple_ARC
Date: 2012-11-26 02:02:57 UTC
From: myronmesecke
Topic: 5443 Message: 5443

It's that time again.

The Temple Christmas parade is Monday December 3rd. I need at least 6 people to help. At least 2 of those 6 need to show up early which means around 2:30.

I will be at the corner of 8th street and Barton avenue. You can park in the back of the Bell County Health Department building which is the old school building on 8th street between Barton and Calhoun avenues.

If you go to the Files directory in the TARC Yahoo group site you will find a Folder that says Temple Christmas Parade. There are two files, the instructions and the map. Print them out and bring them with you if you can. I will have some copies with me.

I need one worker to be on 6th street where the dignitaries line up and 5 workers on 8th street. (6th street usually has goodies; food and drink for the dignitaries).

IF there is a particular intersection you want to work let me know. I will try to accommodate you. If you choose Calhoun avenue for instance you will be covering the intersection of Calhoun and 8th and the block of 8th street between Calhoun and Barton.

You should be able to park you car on the avenues near your intersection. Useful in case of cold or to be able to reach any supplies you might need.

The staging will be busiest from 4:00 P.M. until the parade starts. So if you can't get there early don't worry. I will still need you later so come on out.

Anyone willing to work please let me know. My email is meseckem@... and my home phone is 770-0529. If you call leave your number. Emailing me would be best.

Nothing major has changed from the past couple of years so there should be no surprises and no problems.

For anyone who is interested on what instructions the drivers of the floats get for the parade the line up meeting is Tuesday November 27th at 6:00 P.M. at the Mayborn center in Temple. I will be there but you don't have to come unless you are curious.

I will post again after this Wednesday's parade meeting. And will post weather and info updates as we get closer to the date of the parade.

This years theme is Christmas in Texas so your boots and hats are good if you can manage to walk on a hard street in cowboy boots.

From: myronmesecke
Topic: 5448 Message: 5448

The Christmas parade is counting on us once again.

Weather will be nice. About 80 degrees by midday probably about 70 degrees come parade time. No need for a heavy coat or gloves. Nice and easy.

I will have maps and instructions for everyone. No need to print yourself a copy from the files.

Bring a HT, safety vest if you have one, flashlight and something to write with. We will operate simplex 146.52.

I will have the 2 or 3 extra vests the club owns with me in case you don't have a vest.

Bring snacks or drink if you need them.

One or two people by 3:00 P.M. would be great. It will get busy around 4:00 P.M. so please show up by 4:00.

You can park behind the old Lenier elementary which is the Bell County Health building. Find me at the corner of 8th and Barton.

I have two confirmed helpers and I probably know of two more. I need at least six and can make use of as many as show up.

See you Monday afternoon.

Hi Dave -

Yes, we were short staffed for nearly 6 months. A staffer was out on medical leave with an unexpected and serious health issue.

We had some part time help during that time but it took awhile to train personnel and get them acclimated. This all occurred during our busiest time of the year.

Over the years, our VE's have gotten used to our outstanding service record of processing exam sessions to FCC the same day or within two days of receipt in our office!

During that 6 month time frame, on average we were processing sessions to the FCC five days after receiving the session package in our office.

The VEC staff member that was absent for all those months is finally back to work as of mid November.

Our department is now at full staff and is working hard to return to our previous proficiency level.

73, Maria AB1FM

Sincerely,

Maria Somma, AB1FM

The ARRL VEC has had very poor processing for at least 6 months. I have had
to call on two occasions to get them in gear.. I have considered changing
to W5YI as my base VEC because of this. I was told some key player was ill
or injured.

5452. End Of the World Special Event Station

Yahoo group: Temple_ARC
Date: 2012-12-07 03:31:44 UTC
From: Rocket
Topic: 5452 Message: 5452

Pass along to everyone.....

End Of the World Special Event Station

That's right! The end is finally near.

According to one of the three Mayan Calendars, the end of the world will occur on Dec 21, 2012. To celebrate this literally once in a lifetime event, Special Event Station N0D (Now Zero Days) will be activated for three days.
December 20, is a celebration of the end of the world.
December 21, the day of destruction, we will be on the air as long as possible.
December 22nd, that is a little iffy right now.

Amateur radio stations around the crumbling globe are invited to contact N0D, who will be operating from a secret undisclosed location. QSL with SASE via KK5W, the address is in QRZ. If Doomsday actually does happen, we regret that a QSL will not be possible so don't mail your QSL request until it is safe.

<http://www.nowzerodays.com/>

<http://www.qrz.com/db/N0D>

Looks like a great event to work!!

To: Mark Fox
Subject: NWS UPDATE: Sunday/Monday Cold

Good afternoon,

A significant weather change is heading our way, impacting North Texas Sunday through the early part of next week. The big story will be the marked change in temperatures, culminating in a hard freeze across the entire area by Tuesday morning. We'll also have the potential for snow in our northern counties, and light rain elsewhere. The attached graphic shows the area most likely to be affected by Monday morning.

BOTTOM LINE

Local elected officials, emergency managers, and public safety officials should monitor the forecast throughout the weekend. There is a potential for snowfall late Sunday and early Monday, especially across the northwestern third of North Texas. Much colder temperatures will affect everyone by next week. Snow will affect relatively few across the area. Continue to monitor National Weather Service forecasts, outlooks, graphics, and social media for further refinement of this forecast.

IMPACTS

Cold Temperatures and snow

AREAS of concern

The cold temperatures will affect everyone by Monday. The potential for snow is north of a line from Eastland.to Dallas.to Paris. The most likely for accumulating snow is north of a line from Breckenridge to Gainesville. (See graphic for a better representation)

OVERVIEW / TIMING

A strong cold front will dive southward out of Canada and sweep through North Texas during the day Sunday. We'll really feel the arrival of this front, as gusty north winds develop and temperatures drop sharply over a few hours' time. We'll probably see wind chills sliding into the 30s by Sunday evening. As the front moves through, an upper level storm system will be approaching from the west. This system and the front will work together to trigger some scattered areas of rain, particularly east of the I-35 corridor Sunday and Sunday night. In areas of western north Texas, the combination of cold air and moisture may be sufficient to produce some light snow late Sunday night and Monday morning, which could accumulate in a few spots. All the rain (or snow) should be over by midday Monday, setting the stage for a significant freeze across North Texas by early Tuesday morning.

FORECAST CONFIDENCE

Forecast confidence at this point is low. The event is still three days out, and there are plenty of questions about the details in this forecast. The best forecast is for light accumulations of snow in the far northwest, with the remainder of us seeing flurries. There is a possibility for snowfall to be higher. However, that is a low probability forecast for now.

Favorable factors: Cold air will be in place. Moisture will be available for precipitation.

Unfavorable factors: Amount and depth of available moisture are uncertain. So is the track of the upper level features. As is typically the case, the exact track of the upper level features will play a critical role on who gets snow and who doesn't.

Here is the Austin/ San Antonio take on the upcoming cold event.

I tend to have more faith in their reports since they have a major metropolitan area just to our south (in my opinion we are part of that area). FTW has long had a problem with anything south of Waco.

Subject: Strong cold front expected on Sunday Afternoon...big changes for Monday and Tuesday

South Central Texas Partners...

Colder temperatures are on their way. Saturday and Sunday will feel very spring-like with highs maybe hitting 80 in several spots of South Central Texas. The strongest cold front of this early winter season will enter the Hill Country on Sunday Afternoon and push through all of South Central Texas by early Monday morning. As the front pushes through on Sunday, there is a chance for Thunderstorms mainly east of Highway 281. While there could be some strong storms, we are not expecting any sort of significant severe weather. Unfortunately overall rain chances will remain fairly low.

As the cold air rushes into South Central Texas late Sunday night and early Monday morning, temperatures will fall into the 30s and 40s. With strong northerly winds behind the front...wind chills by early Monday morning will be in the 20s and 30s throughout the region...with some wind chills in the teens across the Hill Country. High temperatures on Monday will remain in the 40s...with wind chills in the 30s.

This very cold airmass will set the stage for widespread freezing temperatures both Tuesday and Wednesday mornings. We could see readings into the lower 20s in the Hill Country...upper 20s across the I-35 corridor...and lower 30s to the Southeast. Some low spots in the Hill

Country could even see some upper teens.

At this point, we do not expect any winter weather precipitation. Please watch the forecast over the weekend by logging into our website at www.weather.gov/austin. I will send out another update this weekend if it looks like there are significant changes to the forecast that will impact the area.

BCC to many

I have to apologize for my lack of action for the past weeks and months. We had excessive ragweed and other such weeds at our place this fall and it put me in bed for a solid month and in and out for another month. I have just got my energy and attitude (referred to as P&V on occasion) back in the last two weeks and am going to try and play catch-up.

FWIW, we are located in the driest spot in this part of Texas. At the Austin Summer Fest SKYWARN session, a small portion of Bell, Williamson, and Milam Counties was highlighted as being behind the other areas in drought recovery. Over the past three years our good plants have dried up and the noxious weeds have taken over. I have no choice but to be in the middle of the weeds as I fulfill our requirements for wildlife management on the property. It hasn't gotten any better, in October we had 0.15 inches of rain and it took 3 events to get that; November produced no rain at all.

When I finally started looking at things I was literally over a thousand emails behind and had stuff that had to be attended to on our place. I threw up my hands in surrender. I still have not caught up on either but with the cold front headed our way I am going to be inside for several days so this is the time to catch up on the communications end.

I also realized that I have overloaded myself in projects and responsibilities and will be evaluating which ones I am going to drop. I will continue to participate in all of the groups I work with but responsibilities will be dropped.

My jobs and responsibilities to Austin Power Squadron WILL NOT change since this has long been my first priority. (APS is a unit of the United States Power Squadrons, a boating education organization. I have been active with USPS since 1971 in many capacities.)

I especially have to apologize to John Galvin, the ARRL NTX SEC, for dropping the ball on my DEC responsibilities. I will work especially hard on getting that corrected.

I am probably going to drop VE Liaison activities after the next TARC Hamfest in April. I have a volunteer to take the job, but she, like me, is over seventy and overloaded so I am looking for a younger person to take over that job. It requires an Extra Class License and VE accreditation with the ARRL. I will assist the new person as needed.

My weather/ SKYWARN related activities will pretty much remain as they are. Unfortunately this has required very little time over the past three or four years.

My ARRL commitments are under review.

I also need to assist in getting the RAC-L (Central Texas Trauma Council) amateur radio system back up to full capability, This is an 'as needed' job.

My activities with the Belton Police Department civilian program (C.H.I.P.S.) will, if anything, get more active. I really enjoy meeting and interacting with the people at the different events and I have no responsibilities except to selectively participate.

I will also continue to support the Bell County EOC through the BCRES group as needed. It will have the highest priority when a major event occurs.

I will also continue to support the Central Texas Amateur Radio Club (CTARC) as needed but not as an officer.

Enough of this, now back to work.

Hi Joe,

I read your note and I am not sure what I can help with, but I am happy to volunteer for pretty much anything someone would ask me to do so for. While my wife grew up here, we are new (again) to the area and are eager to be as involved as much as possible, so if you (or anyone) needs a volunteer for pretty much anything, then by all means please ask.

Photos of the 2012 TARC Christmas Party at Wildflower Country Club (Dec. 6, 2012) are on TARC's Yahoo Groups site. They are listed under "Photos." You'll find two albums, with some duplication. Thanks to Roy Wells, N5HQR for these photos. If you're a group member and have additional photos of the party, you may upload them to either album.

Joe,

Ran across this bit of information from the SOC and thought you and your EC's might be interested.

73, John

"The State of Texas State Operation Center (SOC) received an initial report of power utility poles on fire along a line through Bell, Falls, McLennan and Hill Counties. Reports of approximately 61 power utility poles have caught fire, causing power outages for approximately 1112 Oncor Power subscribers in the City of Perry in McLennan County. The National Weather Service (NWS) Fort Worth reported that the possibility exists with the presence of a collection of dirt and debris along the transmission lines, and the presence of dense fog in the area. Oncor Power, Texas Department of Transportation (TxDOT), Local Fire Departments have responded. (DPS Communications Waco, NWS Fort Worth) DDC 23 Waco"

We give tests on an 'as requested' basis and with a couple of days notice I can usual arrange for a test session. The only scheduled tests are in conjunction with the Belton EXPO's in April and October. The 'test by request' sessions are usually in Belton.

Skip participated on our 147.140 Thursday net and asked about a test session so we arranged one.

Subject: NWS UPDATE: Christmas Week

Good afternoon,

We're still looking at a significant weather change just in time for Christmas, and this will definitely include a sharp drop off in temperatures. Right now, we also face the possibility of snowfall for at least part of North Texas by Christmas evening/night. There remain differences in the forecast models we rely upon, and thus the forecast itself (regarding precipitation, at least) is still pretty uncertain. However, we'll share what we do know, and the attached PDF will hopefully help with this.

BOTTOM LINE

Local elected officials, emergency managers, and public safety officials should continue to closely monitor the forecast. While the weekend will be relatively mild, a strong cold front will bring colder temperatures to North Texas by Christmas Eve. These cold conditions will persist through the middle to latter part of Christmas week. On Christmas Day, a storm system moving out of the Rockies may bring light accumulating snow to areas along and north of I-20, with the best chances closer to the Red River. Some impacts - mainly to bridges and overpasses - may occur by Christmas Day evening and night. Confidence in the forecast is still not great, and refinements will likely be forthcoming this weekend. Continue to monitor National Weather Service forecasts, outlooks, graphics, and social media for

updates.

IMPACTS

Cold temperatures, winds in the 15-30 mph range, and possibly light snow. Areas north of Interstate 20 will see temperatures drop mostly into the 30s by Christmas Eve and stay cold through at least Wednesday. Readings will drop off into the 30s and 40s across the remainder of North Texas as well by Christmas Day. Based on current indications, scattered light rain will develop over North Texas on Christmas, and transition to snow along and north of Interstate 20 by Christmas Evening. Amounts - if any - would remain around 1/2 inch or less, limiting impacts mainly to slick spots on bridges and overpasses. If the storm system develops stronger and tracks farther south than we anticipate, we could see some bands of heavier snow, bringing somewhat higher amounts and increased impacts to area roadways. A stronger than expected storm system could also result in some frozen accumulation on power lines, which combined with the strong winds, could result in scattered power outages.

AREAS OF CONCERN

Cold temperatures and gusty north winds will affect all of North Texas by Christmas. All areas along and north of Interstate 20 could see a transition from light rain to snow late on Christmas. Based on current indications, the main area of concern for accumulating snow - and possible impacts to roads/bridges - would be in the counties close to the Red River. As mentioned earlier though, a stronger storm system would bring additional accumulations and slick spots southward into the Interstate 20 corridor.

TIMING

Much colder temperatures should return to North Texas by late Sunday night, as a cold front dives southward through the area. This cold weather will persist through the middle of Christmas week. The main threat of snowfall would be in the late afternoon hours of Christmas day, extending through early Wednesday morning. Any snow that does occur should taper off and end after midnight Wednesday.

FORECAST CONFIDENCE

Overall forecast confidence at this point is moderate. We're quite confident that it's going to turn much colder for Christmas week. What we're less certain of is the exact track and strength of the storm system due to arrive on Christmas, and the amount of moisture it will have to work with. Both factors will obviously dictate how much, if any, snow we experience. Right now, our confidence in the location and amount of any accumulating snow is low to moderate. We will obviously be assessing this system closely, and refining our forecast through the weekend.

To: Paul Yura - NOAA Federal
Subject: Changes expected on Christmas Day, chances for Thunderstorms

South Central Texas Partners....

...Storm system will bring big changes for Christmas Day, chances for Thunderstorms

Highlights:...A storm system will cross North Texas on Tuesday. There will be a chance for showers and thunderstorms late Monday night through Noon on Tuesday for areas of South Central Texas mainly east of a Burnet to New Braunfels to Cuero line. Some storms may be strong to severe. Best severe chances however will be well east of the Austin-San Antonio area.

Discussion:...A strong storm system currently hitting the Pacific Northwest will enter the Rockies on Monday, TX panhandle Monday night...and cross North Texas on Tuesday. There will be plenty of energy with the approaching storm system Monday night and early Tuesday so showers and thunderstorms may form mainly across the eastern sections of South Central Texas. We are thinking that the best rain chances will be east of a Burnet to New Braunfels to Cuero line. The best timing we see now for this shower/storm threat would be from midnight to Noon on Tuesday, Christmas Day. Even though it is December, the atmosphere will be springlike, thus giving us a slight risk for severe thunderstorms. The severe thunderstorm risk area is primarily over East Texas and points farther east into the Lower Mississippi Valley. This risk does get close enough to us that I feel comfortable to at least talk about the threat....especially in areas across Lee, Fayette, and Lavaca counties.

Unfortunately we are not expecting a ton of rain with this system, but if we are lucky, the eastern half of the area could see some spots with a 1/4 or

1/2 inch by midday Tuesday. Big changes will occur behind the system with a cold front pushing through South Central Texas by midday on Tuesday. Windy conditions will develop with cold air then arriving Tuesday night and early Wednesday. Look for wind chills in the teens by Wednesday morning. Freezing temperatures are expected both Wednesday and Thursday mornings. Highs on Wednesday are expected to be only the 40s to lower 50s.

Please continue to monitor this forecast and weather system by going to the National Weather Service website at www.weather.gov/austin

All,

Temple Amateur Radio Club has a special program scheduled for our January meeting this Thursday at 7PM on software defined radio technology. Greg Jurrens, K5GJ, from FlexRadio Systems will be our guest speaker. TARC and non-TARC members are invited to attend. I am sure Greg will be prepared to answer your questions on software defined radio technology and FlexRadio products.

5468. FLOYD BUMPUS, N5EL ****Silent Key ****

Yahoo group: Temple_ARC
Date: 2013-01-05 17:33:25 UTC
From: Joe Dorn, W5VEX
Topic: 5468 Message: 5468

It is with great sadness that I must pass on the information about Floyd Bumpus, N5EL becoming a silent key. Floyd was a beloved member of the Central Texas amateur radio community and very well known for his love of Morse code in either flavor, American (as used by the railroads) and International (as used by the rest of the world). Floyd was available as an Elmer (mentor) to anyone wanting to learn or improve their code skills. He gave demonstrations of the two codes on numerous occasions and was a docent at the Temple Railroad Museum where he demonstrated the old railroad Morse code techniques complete with the Prince Albert Tobacco can amplifier.

He was in charge of the Morse Code Testing for amateur radio licensing in our area up until the 13/20 WPM requirement was removed. I had a sight impaired license applicant that insisted on taking the Morse code test just before the code requirement was totally removed and I called Floyd out of retirement to administer the test. This was quite likely the last code test given in Texas.

Floyd and his wife Wilma, also a SK (I apologize. I do not remember her call) were active in the Temple Amateur Radio Club and attended most of the meetings with a smile and perhaps a tale from his home state of Arkansas. Floyd had a twin brother that was also a Morse code addict. The brother passed on several years ago.

Floyd and his son Dave manned the Morse code operations for the TARC Field Day operations up until recently and contributed significantly to the annual FD score.

I have had a very difficult time getting information about his funeral arrangements but with the assistance of Hal Pagel, N5JLL I have come up with the following information.

The funeral will be at the Scanio-Harper Funeral Home on Airport road at 1:00 PM on Monday. There is no prior family visitation as far as I know. The funeral home web page has no information at all about Floyd.

I will be blind copying this to my various lists since Floyd was very well known by most of us older hams and there is little other information available about his death or the arrangements.

RIP Floyd.

From Steven KE5VSW. One of my Technicians (Scott Gage) has some test equipment for sale. It is military surplus. If anyone is interested you can contact Scott directly. I was going to bring the list to the last club meeting but we couldn't come (Caleb was sick).

Scott's personal mobile number is (432) 386-0236, his email is scott.gage@..., it you are interested or have any questions. I looked at the multimeters, I've never seen such huge bench meters. I guess they were used in a lab or something.

73's, Steven KE5VSW & clan.

Here is the list:

Description, Manufacturer, Model Number, Price, Qty

MULTIMETER, Fluke, Fluke 8520A, $125.00, 4

FIELD STRENGTH METER, Narda, 8616, $65.00, 1 Has no probes or power cord or probe

FREQUENCY MEASURING, HP, 5245L-E14, $150.00, 1

OSCILLOGRAPH, SYPRIS DATA SYSTEMS INC. DIV CENTENNIAL, 1858T79, $200.00, 1

This is the first I have heard of any restrictions in Nolanville (for those of you not familiar with the area Nolanville is on US 190 between Belton and Killeen and is best known as a speed trap.) and I will bring it to the attention of as many people as I can I would suggest that you ask the people involved to revisit their position since it might bring a significant legal expense to the city.

You might also suggest that they visit Harker Heights since there are several active hams there

Any assistance and guidance would be appreciated. I personally have never been involved in an antenna restriction situation .

Subject: Town of Nolanville and Ham Radio

To whom may it concern:

My name is Carlos Crespo, WP4MZR. The purpose of this email is to reach out to Bell County Communications Center personnel, as well as, other Ham Radio operators in the area for assistance concerning zoning restrictions on Amateur Radio stations.

I have been a Nolanville, TX resident since 2005 and have operated a VHF/UHF station at my residence with no issues until recently. Just yesterday, Nolanville city officials told me that Ham Radio stations were not allowed within residential areas. It all started after a trip to City Hall for some questions regarding antenna regulations.

I upgraded my Ham Radio license recently, so I bought a HF radio, a multiband vertical antenna, and acquired three used sections of Rohn 25

tower. The initial plan was to install the tower bracketed to the back of my house. The antenna is 27ft long itself, so I was concerned about how high it could be installed without needing a permit.

On January 9th I went to City Hall and spoke with Public Works director, Bob Peña. He informed me that the maximum allowed height for the antenna is 35ft above ground and that anything higher would require a $200 "special use permit" with the pertinent engineering documentation for approval.

Two days later, I returned to the City Hall with more questions. I asked Mr.Peña if the 35ft limitation is for the support structure itself or if that included the antenna length. He said that it is for the entire assembly, tip to ground, and that I could not use the tower sections. This was not a big deal, as I could have just install the antenna at 8ft above ground using a short pipe and still be in compliance. I proceeded to ask for a copy of their antenna regulation or ordinance to which Mr.Peña could not produce because they don't have one. Instead he started asking questions about why I need to use a tower, why the antenna is so big, why it has to be elevated, and so on.

After explaining to Mr.Peña what Ham Radio is and how antennas work, he tells me: "Ham Radio is not allowed in a residential zone because of radio transmissions". I explained to him that Hams are licensed by the FCC to do so, and if that was the case, then the city would have to ban all wireless devices as well.

Then he asked if I could move my station to a commercial zoned area. I replied, Ham Radio is not a commercial service. Then, Mr.Peña showed me part of a document with tabulated services, and the zones that they are allowed to be operated in. He pointed to me the one that read "Communications Tower(Commercial)" and then the zones allowed. I told him, yes but this applies to commercial radio services, just like it says, not Ham Radio. At this point, MR.Peña became very unprofessional, said he could no longer help me, and left.

There was another city official that was there listening to the conversation. I don't know his name and I'm not sure of his job title, but I believe that he is the city manager. He made some suggestions like putting the antenna inside the house, and some other non-sense. This guy had no idea what Ham Radio is, so I went on with my speech, again. After my explanation, this guy was still totally lost, so I kindly suggested him to read about Ham Radio on the internet.

I went ahead and followed the ARRL recommendations, and prepared a document package containing Part 97, PRB-1, the antenna guide for city planners, as well as a copy of my Amateur Radio license to drop it off at City Hall Monday January 14th. Also, I highlighted the sections pertinent to antenna structures. Still, I have the feeling that I'm just wasting paper, and there will not be a resolution unless Bell County officials step in and take a look into this matter. Please, feel free to forward this email to the proper channels.

From: Vern Six
Topic: 5475 Message: 5477

Here's an attorney who represents many hams faced with similar nonsense as what is being attempted in Nolanville.

http://www.antennazoning.com/

In one of his conferences I attended, this attorney did say that while PRB-1 requires that cities allow ham radio stations, members in a CCR agreement such as in a home owners' association do not get the protection of PRB-1.

Hope this helps!

Info on the Houston Hamfest can be found at http://www.houstonhamfest.org/
And the cool thing is, it doesnt' fall on the weekend of my Wife's Birthday
this year!

Thanks Brian KA5BKG for the posting about the Texas State Parks On The Air
TSPOTA to be held on April 6th and 7th.
Sounds like a fun event especially while the weather is typcally comfortable
enough to make camping fun!

> Texas Department of Parks and Wildlife : http://www.tpwd.state.tx.us/
>
> Texas State Parks On The Air: http://www.tspota.com/

Knowing NARS the club that is sponsoring the event, I'd suspect there will
be a table with information about the contest at the Hamfest.

FCC Commercial Radio License News Alert
Heads up to anyone considering taking the FCC Element 7 (GMDSS operator), Element 7 R (GMDSS operator restricted) or the Element 9 (GMDSS maintainer).
The question pools have been revised!

The FCC has released a new question pool for the FCC Element 7 and 7 Restricted. Examinees have the option of testing on the old pool or the new pool until June 10, 2013, at which time the new pool will be in effect and the old pool will no longer be valid.

A new pool for Element 9 has been proposed but no official date of release has been issued at this time. We expect it to be adopted later this year. Examinees may continue to use the old question pool until further notice. Please watch for the release on our web-site at eta-i.org.

Coming Soon .
In a Report and Order released by the Federal Communications Commission on January 08, 2013, the following rules concerning commercial radio operator licenses have been revised.
No official date of effectiveness has been released

The FCC will no longer issue First, Second and Third Class Radiotelegraph Operator Certificates. First and Second Class Radiotelegraph Operator Certificates have been consolidated into a single class. The new license will be called Radiotelegraph Operator License and will be issued as lifetime with no expiration date. Applicants must pass the written Elements 1 and 6 and the telegraphy Elements 1 & 2.

Photographs will no longer be required.

Existing First and Second Class Radiotelegraph Operator certificates, upon renewal, will be converted to the new Radiotelegraph Operator License with no expiration date.
The Third Class Radiotelegraph Operator Certificate will be renewed as a Marine Radio Operator Permit, a lifetime license. Existing Third Class Radiotelegraph Operator Certificate holders may upgrade to the new Radiotelegraph Operator License by passing the written Element 6 exam.

To: undisclosed-recipients:
Subject: NWS Update: Weekend Thunderstorms

Good afternoon,

A period of active weather is expected across all of north and central Texas this weekend. Widespread

shower and thunderstorm activity is forecast across the area as an upper level system and cold front

move across Oklahoma and Texas. Conditions will be favorable for strong to severe thunderstorms,

mainly from Saturday afternoon into Saturday night as a cold front helps organize the thunderstorms

into a squall line.

BOTTOM LINE

Emergency Management, spotter groups, and elected officials should be prepared for potential severe

weather from Saturday afternoon into Saturday night. Spotter groups may be asked to activate Saturday

afternoon into Saturday night.

IMPACTS

Isolated severe thunderstorms with a threat of hail larger than one inch diameter and damaging wind

gusts over 60 mph are expected from Saturday afternoon into Saturday night. Although widespread

rainfall is forecast with amounts generally near or under one inch, isolated heavier amounts will be

possible that could cause minor flooding in low-lying areas and urban areas.

AREAS OF GREATEST CONCERN

Strong thunderstorms are possible across all of north and central Texas, but severe thunderstorms are

more likely in areas along and south of Interstate 20. The severe weather threat areas include the

Fort Worth, Dallas, and Waco/Temple/Killeen areas.

TIMING

The severe weather threat will advance from west to east across the area from Saturday afternoon into

Saturday evening, with the threat diminishing by around midnight. Here are our current estimates on

timing of severe weather threat:

Western areas, including Eastland, Stephenville, Comanche, and Goldthwaite: 2 pm to 6 pm Saturday.

Central areas, including Fort Worth, Dallas, Hillsboro, Waco, and Temple: 4 pm to 8 pm Saturday.

Eastern areas, including Canton, Palestine, and Centerville: 7 pm to midnight Saturday night.

Showers and a few thunderstorms may linger into Sunday afternoon in the south and east, but severe

weather is not expected during the day Sunday.

FORECAST CONFIDENCE

Confidence is high for the development of showers and thunderstorms. There is low to moderate

confidence that the storms will become severe. There is overall low confidence on the exact locations

of severe weather or localized flooding.

Subject: Severe Weather Outlook for Saturday evening into early Sunday

South Central Texas Partners,

...Isolated Severe Thunderstorms Saturday Night Into Early Sunday...

AREA OF CONCERN...Locations along and north of Interstate 10, including the Austin and San Antonio metro areas.

IMPACTS...Large hail (up to golf-ball size) and damaging winds around 60 mph.

TIMING...Some storms could develop by 6 pm, but the main period will be 9 pm to 3 am.

DISCUSSION....A low pressure system and associated cold front will reach the western parts of our area by 6 pm,
then move west to east through the rest of South Central Texas between 9 pm and 3 am. Moist, unstable air will be

lifted by the front and produce a line of showers and thunderstorms. There is enough wind shear for some storms to
produce severe hail (1 inch or greater in diameter) and damaging winds (58 mph or greater). Rainfall amounts will
range from 1/4 inch or less west of U.S. 83 to 1/4 to one inch east of U.S. 83. A few spots east of metro Austin
may get two inches.

A graphic has been attached. Keep informed by going to our webpage at: http://weather.gov/austin

From: Greg Patrick [mailto:gregory.patrick@...]
Sent: Tuesday, March 19, 2013 10:48 AM
To: undisclosed-recipients:
Subject: NWS Update: Tuesday evening severe weather potential

Good morning,

There will be a potential for strong to severe thunderstorms this evening across a small part of north and central Texas. The attached graphic

depicts the threat area, which is generally south of a line from Comanche to Waco to Centerville.

The primary time window for severe weather potential will be from 6 pm to 11 pm. After the storms develop, movement will be to the east

and southeast at 35 mph.

OVERVIEW

The cold front that moved through the area on Monday brought a drier and more stable airmass to north and central Texas. However, daytime

heating and a return to southeast winds will bring some instability back into central Texas by late this afternoon. As an upper level system moves

east from New Mexico, scattered to numerous thunderstorms are expected to develop. Some of the storms could become severe, with a

threat of golfball sized hail and damaging wind gusts over 60 mph. If the air is more unstable than we are currently forecasting, conditions

may become favorable for a brief tornado in the early evening hours.

BOTTOM LINE

Emergency management, elected officials, and spotter groups need to remain prepared for potential severe weather across

the threat area this evening. Spotter groups may be asked to activate anytime from 6 pm through 11 pm.

Some communities that may be affected by strong to severe thunderstorms this evening include Comanche, Hamilton, Goldthwaite, Gatesville,

Lampasas, Killeen, Temple, Waco, Cameron, Hearne, and Centerville.

Most or all of the thunderstorm activity is forecast to remain south of the Dallas and Fort Worth areas through tonight.

As always, don't hesitate to contact us at the National Weather Service if you have any questions.

Thanks,

Greg Patrick

From: strawbalegirl
Topic: 5508 Message: 5508

Hey, this is Steven Sullivan KE5VSW. I wanted to pass on a couple of things that might be of interest. At Baylor there is an upcoming Wireless/Microwave Symposium. Apparently this is held every year, here are the links. Not necessarily amateur radio, but RF. April 4/5. $20 student/$80 non-student. I can't make it this year but hope to make it next year. Here are the links:

http://www.ecs.baylor.edu/ece/index.php?id=61811

http://texassymposium.org/

The other thing I wanted to pass on is a two free webinars on the new LTE and LTE Advanced cellphone networks. LTE uses OFDMA, similar to the RF front end of WiFi and WiMAX. These are hour long webinars, usually 45 minutes of instruction and 15 minutes plugging their test equipment (hence it's free). This is March 26th and 28th. (Since I'm spending all my waking hours studying about LTE, I thought I should "share the love". They have a new $100 book out, however I have a pdf copy of the 2009 version which would be similar enough. Email me if you would like me to get you a copy. Here is the link to access the webinars

http://mwjournalemails.com/portal/public/ViewCommInBrowser.jsp?Sv4%2BeOSSucyBSGlYDa3ngO%2Bqg5Sx7eP7ykb%2FOejwg0fPb7GS54MEZz%2FzsPlyCOXGevu5bA8qYs5a1RHhMsBJXg%3D%3DA

Blessings,

Steven Sullivan KE5VSW

Some thoughts on Mike WA5EQQ's passing.

I became a ham shortly after I graduated high school. (We're having our 30th reunion this year which kind of dates me.) I met Mike when I was studying to take my test to get my ticket. So it would be safe to say that I've know Mike for nearly 30 years. He was always a fixture on the local 82 repeater.

Mike contracted polio when he was 8 years old and was a quadriplegic. I can still remember visiting Mike at home for the first time and seeing the Iron Lung he slept in. I had never seen one in real life, up to that point I had only ever seen pictures of them from the 1950's. A bit of trivia; it is estimated there are less than 100 Iron Lung patients in the US right now.

I guess you could say that Mike got a raw deal in contracting polio. His disease severely limited the activities that you or I would take for granted. Mike had to use his foot to type on the computer keyboard as this was the only limb he had enough control of.

We live in a world that celebrates physical beauty or athleticism. Mike never walked the red carpet at a Hollywood premier. Mike never scored a touchdown during an NFL game. Mike never got to do many of the things that gets you on the cover of a magazine or the accolades of society.

In spite of his circumstances, I don't think I ever saw Mike down or complaining about his lot in life.

Thinking about that is kind of sobering when I want to complain about some minor annoyance like traffic on the way to the office or the checkout line at the grocery store.

I was glad to know Mike. The world was a better place with him here. He will be missed.

A reception will be held following the funeral in the church fellowship hall.

John WD5BFS

My comments.

Mike was truly a special individual that accomplished much while afflicted with one of the most cruel of childhood maladies. Many of you are probably not aware that Mike was one of the last to develop a case of polio and many today do not have a memory of the body devastation and fear that the disease caused. From Wikipedia:

"Until 1955, when the Salk vaccine was introduced, polio <http://en.wikipedia.org/wiki/Polio> was considered the most frightening public health problem of the post-war United States <http://en.wikipedia.org/wiki/History_of_the_United_States_%281945%E2%80%931964%29> . Annual epidemics <http://en.wikipedia.org/wiki/Epidemic> were increasingly devastating. The 1952 epidemic was the worst outbreak in the nation's history. Of nearly 58,000 cases reported that year, 3,145 people died and 21,269 were left with mild to disabling paralysis,[1] <http://en.wikipedia.org/wiki/Jonas_Salk#cite_note-Zamula-1> with most of its victims being children."

I might add that Dr. Jonas Salk salary was about $47,000.00 a year in the 1960's while professional athletes were making in excess of $100,000.00 (a paltry sum by today's standards). This has always been a sore point with me. (JBD/VEX)

Mike lived in or near his 'Iron Lung' from childhood on. The only controlled body part that he had was one of his left toes. Mike completed college (my Mother-in-law, Minnie Henderson (Sarah's mom), had him as a student in her MHB Spanish class and could not say enough good about him.) and went on to write several books (Post Cards From Temple being one that has been recently available.) and participated in church and other civic activities. I heard Lynn Wooley give a short tribute to Mike on his KTEM show earlier today; it was very well done and should be printed in the TARC Bulletin.

Mike served in several offices of the Temple Amateur Radio Club, and was president at least twice. TARC held board meetings at Mike's house for many years so that he could easily participate. Mike also ran the TARC 146.82 weekly net for as far back as most of us can remember; in addition he also participated as a net control operator in the Texas 7290 Traffic Net. Mike has long been the editor of the TARC Bulletin.

In recent years Mike has been the person responsible for the very successful twice annual TARC Hamfest at the Bell County Expo Center. I have had the pleasure of working with him the past several years by conducting the Amateur Radio Tests at the event. This is going to leave "a hole in the water" that may never be filled as well as it has been.

Frankie Baugh, KA5IHY, called us yesterday and left this story with Sarah.

Frankie was in the same Temple High School class as Mike. When it came time for graduation, the school leaders were going to make special concessions for Mike and bring his diploma to him on the floor. At the graduation practice, Frankie in a conversation with one of the other students, said "This ain't right!". They then contacted some of the other students and a plan was devised to get Mike on the stage to receive his diploma. Without knowledge of the teachers, as the time came for Mikes name to be called, members of the football team broke ranks, much to the chagrin of the administrators, and went and lifted Mike in his wheel chair, actually a mobile bed, onto the stage and Mike then joined the procession to the podium. (A tear is in my eye!)

We have lost a truly remarkable individual and friend.

RIP WA5EQQ, SK

5528. Annual Armed Forces Day Crossband Test

Yahoo group: Temple_ARC
Date: 2013-05-03 13:11:00 UTC
From: John Hobson
Topic: 5528 Message: 5528

From the ARRL:

ARRL Web site l.Link for more information:
http://www.arrl.org/news/annual-armed-forces-day-crossband-test-scheduled-for-may-11

Annual Armed Forces Day Crossband Test Scheduled for May 11

In celebration of the 63rd anniversary of Armed Forces Day (AFD <http://www.defense.gov/afd/>), the Army, Air Force, Navy, Marine Corps and Coast Guard are co-sponsoring the annual Military/Amateur Radio Crossband Communications Test. Although Armed Forces Day is traditionally celebrated on the third Saturday in May -- May 18 in 2013 -- the AFD Military/Amateur Crossband Communications Test will be conducted on May 11 to prevent conflict with the Dayton <http://www.hamvention.org/> HamventionR, scheduled for May 17-19.

The annual celebration features traditional military-to-amateur crossband communications SSB voice and Morse code tests. These tests give Amateur Radio operators and short wave listeners an opportunity to demonstrate their individual technical skills and to receive recognition from the appropriate military radio station for their proven expertise. QSL cards will be provided to stations making contact with the military stations.

Military-to-amateur crossband operations will take place on the dates and time in UTC on the frequencies listed <https://docs.google.com/viewer?a=v&pid=sites&srcid=ZGVmYXVsdGRvbWFpbnxhcm15bWFyc3BvcnRhbHxneDoxMzdmYmUzNGRjNzgwZDlh> for the Army, Air Force and Navy/Marine Corps and Coast Guard MARS stations. Voice contacts will include operations in single sideband voice (SSB); some stations will use CW to provide the opportunity to check in by Morse code. Depending on propagation and staffing, some stations may not operate the entire period. Participating military stations will transmit on selected military MARS frequencies and listen for Amateur Radio stations in the amateur bands. The military station operator will announce the specific amateur band frequency being monitored. Duration of each voice contact should be limited to 1-2 minutes. The annual Secretary of Defense message will be transmitted via digital modes, including RTTY, PACTOR, AMTOR, PSK-31, MFSK and MT63 from certain stations.

Check the MARS Armed <http://www.usarmymars.org/home/announcements> Forces Crossband Test website for schedules and frequencies of participating military stations, including a list of stations that will be transmitting the annual Secretary of Defense message. Instructions on how to copy and submit the message are also included.

Subject: Severe thunderstorm potential today and tonight

Good morning,

A moist and unstable air mass remains in place across north Texas, and with a dry line and upper level disturbance to our west, we have the stage set for scattered thunderstorms to form throughout the day today. Some of these storms will be strong to severe, producing large hail and damaging wind gusts. Here are the specifics:

LOCATION AND TIMING:
Strong to severe thunderstorms are possible anywhere across north Texas today. However, we have a little better confidence that they'll occur primarily in areas along and south of I-20. This primary area of concern does include the DFW area...and particularly the Waco area. Areas north of I-20 - up to the Red River - aren't out of the woods; we just think the coverage may be a little less extensive in these counties. A few storms are already forming SW of Stephenville this morning, but we think most of the severe activity will be confined to the afternoon and early evening hours.

PRIMARY THREAT:
Large hail - to the size of golf balls or greater - and wind gusts in excess of 60 mph. There is very little threat of tornadoes today, due to a lack of strong shear in the atmosphere.

BOTTOM LINE:
This isn't an outbreak day by any means, but we do expect a number of severe storms across north Texas later today, with large hail and damaging wind being the threat. Emergency management, elected officials, and spotter groups need to remain prepared for potential severe weather through tonight.

Spotter groups - particularly in areas along and south of I-20 - may be asked to activate anytime from Noon through 10 pm tonight.

If you need additional information or other support, please don't hesitate to contact us via the usual means.

Thanks,

Tom

To: 'K5HM'
Subject: Museum Ships Weekend Event June 1 - 2 2013

Please post this notice on your club reflector or web site.

The Brazos Valley Amateur Radio Club will again participate in this year's Museum Ships Weekend. June 1-2, 2013. Our call sign, KK5W will be credited as a contact with both WW II Submarine USS Cavalla and Destroyer Escort USS Stewart. representing the USS Cavalla and USS Stewart. Visit our web page for more information, www.bvarcmswe.org. We will be operating from, Seawolf Park in Galveston, Texas, NA-143.

WE will have four stations set up, two located in the park, aboard the Cavalla and aboard the Stewart. Weather permitting these stations will be on the air continuously.

We need operators. Amateur radio operators in the Galveston - Houston area are cordially invited to participate. You can sign up on the web page if you would like to operate KK5W during the event at Seawolf Park.

Frequencies as follows:
SSB
7.260 MKHz
14.260 MHz
21.360 MHz
28.360 MHz

CW
7.039 Mhz
14,039 MHz
21.039 KHz
28,039 KHz

Operation on OSCAR satellites is planned for daytime passes on Saturday, June 1.

KK5W will host two VHF Nets for Houston-Galveston amateurs to contact the local museum ships using the WA5CYI repeater 146.94 (-) PL 167.9 on Saturday and Sunday from 11AM - 1 PM Local time. We are anticipating the USS Texas (NA5DV), Elissa (N5E), and the Grandcamp/High Flyer Memorial (AC0TX) will be on the net.

A balloon launch is scheduled for Saturday morning, APRS trackers will use N5BPS (the Cavalla's wartime call sign was NBPS).

Once again, we will be offering the Texas Navy Award.

This year's Texas Navy Fleet is expanded to include:
    USS Cavalla and USS Stewart - KK5W
    USS Texas - NA5DV
    Tall Ship Elissa - N5E
    USS Lexington - W5LEX
    SS High Flyer and SS Grandcamp Memorial - AC0TX
    National Museum of the Pacific War - N5P

For KK5W and AC0TX, one contact counts for both ships. Provide evidence of two way communication (log extract) with at least four of the call signs during MSWE 2013 to earn the 2013 Texas Navy Certificate. Work all six to earn the coveted "Clean Sweep" endorsement.

Subject: HamCon Colorado 2013

Hello,

As you're probably aware, we're gearing up for an outstanding ARRL Rocky Mountain Division Convention to be held in Estes Park, Colorado, June 27-30, 2013.

Yes, you read those dates correctly!

Four days of amateur radio excellence jam packed with technical sessions and forums, a very rare WWV tour, a Denver ARTCC (Air Route Traffic Control Center) tour, superb speakers, W1AW/Ø operations, vendors, exhibitors, a special DX University session, a prominent storm chaser (Tim Samaras of the Discovery Channel), contests, QSL card checking, a silent auction for radios, a visit to the Estes Park Astronomical Observatory, and much more.

We had 500 attendees here in 2009 (the division convention is in Colorado every 4th year), and we're expecting around 650 this time. Our confirmed exhibitor list now includes Arrow Antenna, Flex Radio Systems, Ham Radio Outlet, Icom, Pixel Technologies, RT Systems, Southwest Antennas & Accessories, US Tower, Yaesu, several other pending exhibitors and a number of area clubs and organizations.

Did I mention prizes? We□ve got a ton of GREAT prizes to win!

We'd be honored to meet you and the other Temple ARC members at this stellar event! Would you please consider forwarding this message to your members, and posting it to your club web site? We've got some nice web site banners, and if you'd like to include one of those, please let me know and we'll send them to you right away!

Full details

<http://www.hamconcolorado.org/> http://www.HamConColorado.org.

To: Mark Fox
Subject: NWS UPDATE: Monday Thunderstorm Potential

Good afternoon everyone,

The dry line is anticipated to be active today across the central plains, giving a shot at thunderstorms today. Another chance for thunderstorms exists tomorrow as well, as the main upper level system finally moves across North Texas. Not everyone will be affected by today's storms, but today and tomorrow should be monitored closely. A short PDF has been included to graphically depict the areas and timing.

BOTTOM LINE

There are equal chances of getting severe thunderstorms today.or no thunderstorms at all.

Closely monitor the weather forecast and updates today and tomorrow. The greatest chance for supercell thunderstorms will be this afternoon and evening, across the northwestern third of North Texas. Tuesday will be more widespread rainfall and severe thunderstorms. The tornado potential is the highest today, however. Emergency Managers, elected officials, should be prepared for strong to severe thunderstorms this afternoon and evening, and again on Tuesday afternoon and evening. Storm spotters should be prepared for activation both today and tomorrow.

AREAS OF GREATEST CONCERN

See the attached graphics for a better depiction of the area of the expected hazards.

Thunderstorms: Generally north
and west of a line of a line from Lampasas, Waco, and Athens.

Greatest Risk of Severe Thunderstorms: Generally north and west of a
line from Lampasas, McKinney, to Bonham

Greatest Risk for Tornadoes: Generally north and
west of a line from Graham, Denton, to Sherman/Denison.

POTENTIAL HAZARDS / IMPACTS AND TIMING

Thunderstorms today could produce large hail, near baseball sized.
Tornadoes are possible, especially areas in the northwest, where discrete
supercells are possible. A few storms may produce localized heavy rainfall.

Thunderstorms are expected to develop along the dry line, which is expected
to be roughly along US281 by late this afternoon. The greatest potential for
severe weather will be between 4 PM and 10 PM this evening.

FORECAST CONFIDENCE

Overall forecast confidence is low. See below for the reasoning. However, if
thunderstorms are able to form, confidence is high that they will be severe.

ALTERNATE SCENARIOS

Storm initiation is the main uncertainty. There is a potent cap across much
of the region today, and the cap is stronger to the south of I-20. Above the
cap, there is considerable instability. The primary concern today will be
whether or not the cap can be broken due to heating alone, or whether or not
subtle boundaries can assist in lift. If the cap holds.nobody gets
thunderstorms or even rain. If the cap breaks, the potential for severe
weather is high.

From: Paul Yura - NOAA Federal [mailto:paul.yura@...]
Sent: Monday, May 20, 2013 5:28 PM
To: undisclosed-recipients:
Subject: Severe weather possible on Tuesday across South Central Texas

South Central Texas Partners...

...HEADLINE...Slight risk of Severe Thunderstorms on Tuesday.

...AREA OF CONCERN...All of South Central Texas. It looks like the northern half of South Central Texas, mainly north of I-10, looks to have the best chances of seeing severe thunderstorms. Chances for severe weather increases as you head north along I-35, north of the Austin area into Central Texas and Northeast Texas.

...IMPACTS...Large Hail, damaging winds, and even isolated tornadoes.

...TIMING...Mainly Tuesday afternoon and evening, possibly lasting until midnight.

...DISCUSSION...An upper level disturbance is forecast to move through north Texas, as a weak cold front and dry line approaches from the west. These triggers, along with hot and humid conditions, will set the stage for severe thunderstorm development Tuesday afternoon and evening. While the best ingredients for severe thunderstorms and tornadoes will be to the North and Northeast of South Central Texas (NE Texas and the AR-LA-TX border area), there will be a Slight risk of severe thunderstorms across all of South Central Texas. I do think that the best chances to see severe storms in our area on Tuesday will be along and north of Interstate 10. Storms may in fact form over north central Texas and then move south into South Central Texas by late afternoon and evening. As the upper system pushes east of the area by late Tuesday night, our severe weather chances will diminish.

I have attached a graphic showing the severe weather chances on Tuesday. We plan on issuing an update to this severe weather forecast on Tuesday morning.

You can see the latest forecasts and watches/warnings/advisories by going to the Austin-San Antonio National Weather Service website at www.weather.gov/austin

From: Joe Dorn, W5VEX
Topic: 5538 Message: 5538
Attachments: 1 described; binary payloads are missing from this source WARC

Our area, Bell and surrounding counties, is showing the potential for heavy rains in the automated forecast... The following note is from the South Texas NWS, NOT FORT WORTH, but I expect FTW to put out some info when they finally look to the southern edge of their territory, right after they give the climate data for Dallas and Waco...

I am monitoring the NWS chat rooms for updates...

Joe B. Dorn, W5VEX

7969 West FM 93
Belton, Texas 76513

Home Phone: (254) 939-5918
Cell Phone:(254) 721-0829

From: Jon Zeitler [mailto:jon.zeitler@...]
Sent: Saturday, May 25, 2013 4:32 PM
To: undisclosed-recipients:
Subject: Heavy rain and flood outlook for Saturday evening and early Sunday

South Central Texas Partners...

...HEADLINE...Additional rainfall likely overnight, possibly heavy in the northern Hill Country, Metro Austin, and plains east of Austin.

...AREA OF CONCERN...The best chances for rain will be along and east of U.S. 281, and north of I-10. The best chances for heavy rain will be north of a line from Kerrville to San Marcos to La Grange, which includes Metro Austin.

...IMPACTS...Thunderstorms with heavy rain. The storms will be more scattered than occurred on Friday or earlier today. Locations receiving rain will generally see between one and two inches. Some locations could get between two and four inches. A few spots in the eastern Hill Country, Metro Austin, and plains east of Austin could receive up to 6 inches of rain. A Flash Flood watch will remain in effect through 8 am Sunday for locations along and east of U.S. 281. A few storms may produce damaging wind gusts as well, but we do not expect tornadoes or hail.

...TIMING...A few showers and thunderstorms late this afternoon through late evening. Then a larger area of thunderstorms developing over the Edwards Plateau and eastern Hill Country after midnight and moving east across Metro Austin and the plains to the east toward College Station.are possible this afternoon and evening, possibly lasting until midnight.

...DISCUSSION...
Another upper level wave now over northern Mexico will move across the area tonight. This will combine with moist Gulf air and a weak, stalled front to produce showers and thunderstorms across the area. We expect the storms to be more scattered than the past two days, but they may still move slowly and multiple storms (training) go over the same areas, thus the risk for larger rainfall amounts like we saw Friday afternoon and again earlier today. We expect the flooding seen in Metro San Antonio to continue to recede, although additional rainfall may slow the process or cause rises again if significant rain develops.
A graphic is attached.

Just FYI,
I thought I would offer this additional info in case it helped anyone. I called the number given for the RC to sign up, and they could not find the classes listed in Mr. McCoy's email . (Perhaps the class is already full?) But they suggested another: Disaster Services: an Overview being offered*thisSaturday, June 22 at
*:

Killeen Training Room
208 W Avenue A
Killeen, TX 76541
8:30 a.m.-Noon

You can call the same number, (254) 200-4400, to sign up. There is no charge for this class, and they had room for more. I did not find any disaster training classes listed on their "find a class" web search, so if I hadn't called I would not have known about what was available.

From: April B
Topic: 5545 Message: 5545

Hello,
As I posted this morning on my difficulty locating the classes below when I called the number listed, as it happens I had to call back this afternoon because I never received my email confirmation that the Red Cross worker told me to expect. When I called this afternoon, I was told that the class for which the earlier guy signed me up for is in College Station (he gave me the Red Cross Center address in Killeen.) Please disregard my earlier email, as I was given wrong information. I'm glad I decided to call back because I would have been sitting in the wrong place (Red Cross Center, Killeen) on the wrong weekend. Apparently the Red Cross operates in a parallel universe and my phone service spans the time space continuum. But at least they know where Texas is. The info listed below is correct and there is still space.
I apologize for any confusion I may have caused.

5546. Rohm Tower from the West, Texas Ambulance building

Yahoo group: Temple_ARC
Date: 2013-06-21 21:20:11 UTC
From: Joe Dorn, W5VEX
Topic: 5546 Message: 5546

Anyone looking for a good tower, this may be it.

Joe B. Dorn, W5VEX

7969 West FM 93

Belton, Texas 76513

Home Phone: (254) 939-5918

Cell Phone:(254) 721-0829

From: Bud Garretson [mailto:ad5sk@...]
Sent: Thursday, June 20, 2013 9:25 PM
To: jbdvex@...
Subject: Rohm Tower

Joe,

Wil's computer needs an early bird-it has a worm in it and runs extremely slow, so I'm forwarding the information on the tower.

90 feet of Rohm 25 heavy duty tower, in good condition, with a base plate to anchor it to concrete. The tower withstood the explosion of the West Fertilizer Plant, but the ambulance building was destroyed. It was picked up and laid on the ground by a crane. The price is $50 per section, with the money going back to the West Ambulance Association to rebuild. For more information, contact Wil Geltmeier at 254-576-245 or wgeltme@....

5548. 4th of July Parade

Yahoo group: Temple_ARC
Date: 2013-07-02 12:55:26 UTC
From: Darwin Geiselbrecht
Topic: 1393 Message: 5548

Once again, it is nearing time to help line up the entrants in the big July 4th parade tomorrow in Belton. This is a good opportunity to use our communications gear for a good cause.

I know most have helped in years past. For those who are new to the process, this is a communications exercise using hand held transceivers. If you don't have a handi-talkie, come anyway and we will pair you up with someone who does. We will use the Belton repeater on 147.3 with a 123 PL tone. This has always given us excellent coverage.

We will meet Thursday, July 4, at 7:30. We will meet at our usual spot in the parking lot that is at the first left off 10th street after going in the main entrance of Mary Hardin Baylor (MHB) at the corner of 10th and 317. Maps and lists will be available then.

The construction on Crusader Way has been completed. So we shouldn't have the hassles associated with the parking lots we had last year. They plan on putting more of the line up on the campus this year and minimizing the number of line ups on Industrial.

The chamber has promised us golf carts, so if you have a limitation concerning standing or walking, we should be able to get you in a cart.

If you have high visibility safety vests, please bring them. Otherwise, I believe Jake from the Chamber of Commerce will have some available.

We will help with the line up as soon as deployed at 8. The parade will roll at 10.

Our excellent weather of the past few days should continue, so it will not be as hot as usual. Even so, bring a big hat and long sleeves. There should be water available from the Chamber of Commerce. As far as the heat is concerned, we will be complete by about 11AM before the worst part of the day.

We welcome the participation of CTARC members who make a valuable contribution to several of our outings. Please post this to any CTARC reflectors.

Thanks in advance for your help and see you thursday. 73 - Darwin K5DOA

5551. Meeting Program for Tonight

Yahoo group: Temple_ARC
Date: 2013-07-11 18:51:55 UTC
From: Darwin Geiselbrecht
Topic: 5551 Message: 5551

I have had several folks ask about HF antennas for limited space situations. The program will address that along with some real world examples from some of our members.

See you there - 73 - Darwin K5DOA

5552. Free Hurricane Weather Alert Subscriptions

Yahoo group: Temple_ARC
Date: 2013-07-24 18:19:27 UTC
From: kevinmccoy_us
Topic: 5552 Message: 5552

NHC discontinued its email delivery service in November of last year. GoDelivery.com stepped in and had this as a free service until August 1 this year. Sigh.

If you use this service then you should be aware that there are numerous other free services available. (A list is here: http://www.weather.gov/subscribe)

One that is not listed but should be close to our ham hearts is the National Hurricane Watch Net Service - http://hwn.org/

I have been trying that out, and it is working for me!

Welcome to our area's newest ham, Bob Gleason, KF5WSQ

Bob is a very good friend of Jim Coleman.

The turnaround was fast on this one. I put it in the mail late Tuesday and it has already processed.

Looks like we are getting close to the end of the "KF5'S"

Bob, I am usually monitoring the 147.14 repeater if you would like a radio check.

Joe B. Dorn, W5VEX

5558. TARC Christmas Party 13 December 2013 Menu

Yahoo group: Temple_ARC
Date: 2013-09-05 02:39:39 UTC
From: Rocket
Topic: 5558 Message: 5558

The TARC Christmas Party is coming soon.

It will be held on 13 December 2013 and the Knights of Columbus Hall at 2218 West Ave. D. starting at 7pm.

We need a head count and the sooner the better!! We are planning for at least 70 people in attendance.

Music this year will be provided by Pam Bland.

The main entries: we need to know whether you want the grilled chicken breast or the grilled pork steak. I can attest, Both are VERY GOOD!!

the vegetables are:
Green Beans
Au Gratin Potatoes
Salad

Drinks:
Tea, Coffee, Water

Desserts... Please give us some ideas on what you would perfer... Bun cake, Cheese cake, sheet cake??

So please let us know ASAP.. Please get your reservation made soon. The cost for the members is $5 dollars a head, and the club picks up the rest of the bill.

Any questions?? please drop the board a note.

Thanks

5561. Texas QSO Party

Yahoo group: Temple_ARC
Date: 2013-09-10 17:01:52 UTC
From: Terry
Topic: 5561 Message: 5561

Hi folks

Just a reminder the Texas QSO Party is on the last weekend of this month. TQP runs Saturday, September 28 from 9AM to 9PM Texas time, and from 9AM to 3PM on Sunday. The exchange is simple - you give out a signal report and your county (as 59 Bell) ; you receive a signal report and state/province/DX. Full rules and info are at: http://www.txqp.net/

Enjoy your celebrity status by calling CQ! Usually 20M is the "money band", but 15M may be good, too. But for even more fun, pop down to 40M every so often and work the Texas mobiles. You'll find that they are generally on the same frequency and that they change counties every 20-30 minutes. You can work them in each county.

Got HF mobile, jump in that mobile and roam around a bit and hand out some Texas counties. You will be popular.

Terry

5562. FW: Heavy rain potential over the next 36-48 hours.

Joe B. Dorn, W5VEX

7969 West FM 93

Belton, Texas 76513

Home Phone: (254) 939-5918

Cell Phone:(254) 721-0829

From: Paul Yura [mailto:paul.yura@...]
Sent: Thursday, September 19, 2013 9:29 AM
To: undisclosed-recipients:
Subject: Heavy rain potential over the next 36-48 hours.

South Central Texas Partners...

...HEADLINE...There is a potential for locally heavy rains over the next 36-48 hours.

...AREA OF CONCERN...All of South Central Texas, especially along the Rio Grande River and the western Hill Country.

...IMPACTS...Tropical downpours with rain rates higher than 2 inches per hour. Rain totals over the next 48 hours averaging up to 1 inch...with isolated rain totals over 4 inches. Rises on the Rio Grande likely. Urban and small stream flooding likely. Isolated Flash Flooding threat. Friday night football games will get impacted. A few lightning strikes are possible and need to be monitored.

...TIMING...Locally heavy rain threat will continue all day today near the Rio Grande and the far western areas of South Central Texas. Heavy rainfall threat will peak Friday afternoon through Friday night across all of South Central Texas.

...DISCUSSION...Tropical moisture from Pacific Hurricane Manuel will combine with an approaching cold front to produce locally heavy rains over South Central Texas through early Saturday. Hurricane Manuel is along the western coast of Mexico and upper level winds are spreading moisture from this system all the way into Texas. At the same time, a weak cold front will be pushing down into Texas by Friday morning and is scheduled to cross South Central Texas sometime Friday evening or Friday night. This front, combined with the tropical atmosphere, should allow for widespread rains across the

area. The main threat will be the intense tropical downpours and rain rates in excess of 2 inches per hour. This will lead to runoff, and possibly some flash flooding. Rains have been spotty over the past week so much of the area is still relatively dry and can take quite a bit of rainfall. But even with the dry soils, the intense rain rates can still lead to flooding. We are looking at widespread rainfall averages around 1 inch or so...but we can expect isolated totals maybe over 4 inches. Flash Flooding is not out of the question. There is a much higher threat for minor flooding/ponding of water in urban areas and rural roads. Some low water crossings may be impacted.

Northern Mexico has been getting quite a bit of rain from both Hurricanes Manuel and Ingrid. Runoff has been increasing along and into the Rio Grande over the past week. Look for this to continue. Residents and Emergency management along the Rio Grande need to watch this event closely as more rainfall across northern Mexico will make the flood threat even higher.

In previous years, we have seen flood events when fronts combine with Pacific coast hurricanes and tropical systems. Emergency Management, first responders, and planners need to keep a frequent weather watch over the next 48 hours. You can see the latest forecasts and watches/warnings/advisories by going to the Austin-San Antonio National Weather Service website at <http://www.weather.gov/austin> www.weather.gov/austin

Sent: Thursday, September 19, 2013 4:02 PM
To: undisclosed-recipients:
Subject: Heavy rain and Flash Flood Potential Through Early Saturday Morning

South Central Texas Partners,

...HEADLINE...Moderate to high chance of heavy rain and flash flooding.

...AREA OF CONCERN...All of South Central Texas, especially along the Rio Grande River, on the Edwards Plateau, and in
the western Hill Country.

...IMPACTS...Tropical downpours with rain rates higher than 2 inches per hour. Rain totals over the next 48 hours will average up to 2 inches, with some spots near the Rio Grande receiving 4-6 inches of rain. The Rio Grande and other rivers west of U.S. Highway 83 are likely to rise substantially. Urban and small stream flooding is possible elsewhere. Those attending Friday night football games should be prepared for rain, be ready to seek shelter in buildings or cars if lightning develops, and be extremely careful driving home after the game and not try to drive anywhere where water covers the road. Turn around, don't drown!

...TIMING...Locally heavy rain threat will continue tonight along and north of a line from Del Rio to Rocksprings. The best chances for heavy rainfall will be Friday afternoon through Friday night, especially west of U.S. Highway 83 and south of U.S. Highway 90 (i.e., the Eagle Pass area).
...DISCUSSION...Tropical moisture from Pacific Hurricane Manuel will combine with an approaching cold front to produce locally heavy rain. Rains have been spotty over the past week, so much of the area is still relatively dry and can take quite a bit of rainfall. But even with the dry soils, the intense rain rates can still lead to flooding. Northern Mexico has been

getting quite a bit of rain from both Hurricanes Manuel and Ingrid. Runoff has been increasing along and into the Rio Grande over the past week. Residents and emergency management along the Rio Grande need to watch this event closely as more rainfall across northern Mexico and in our area will increase the flood threat.

In previous years, we have seen serious flood events when fronts combine with the remnants of Pacific hurricanes and tropical systems. The latest forecasts and watches/warnings/advisories are on the Austin-San Antonio National Weather Service website at <http://www.weather.gov/austin> www.weather.gov/austin

5564. October Expo VE Testing...

Yahoo group: Temple_ARC
Date: 2013-10-01 23:33:34 UTC
From: Joe Dorn, W5VEX
Topic: 5564 Message: 5564

Once again I am very late soliciting assistance for the VE testing at Ham Expo this Saturday. I have been preoccupied with other issues and lost track of the Expo..

We will set up for the test session around 9:30...

I need ten VE's to do the job properly. PLEASE RESPOND TO THIS NOTE IF YOU CAN ASSIST.

As usual advise the gatekeepers that you are there for the VE test and you get free admission and an invitation to the after Expo breakfast.

For those that are interested, I understand there is a gun show at the Expo this week end also not related to the ham stuff).

Joe,

Trying to collect some data for HamEXPO support. How many showed up for Ham tests by tech, general and extra and how many passed for each class? How many VEs did you have supporting the exam session. I am also gathering similar info for number of HamEXPO attendees and number of those helping setup on Friday and supporting on Saturday.

You help is appreciated.

Subject: Wind Damage at Dornville...

(15:19:47) skywarn-joe.dorn: We had extensive local damage last night at about 10:15 pm that apparently did not extend past our property... I have been in a few storms and a couple of typhons but I have never hear anything like what took place right over our house. We live on two hundred acres two miles west of the courthouse in downtown Belton, our house yard area is about five acres and about four of those acres are in the damaged area. we lost several large trees and numerious branches and and the roof off a utility shed. I would estimate the winds were at least 90 MPH and straight line with large hail and much weather noise. We received 3 5/8's inches of rain, all in about ten minutes. I have probabaly over a hundred photographs of the daamage and will dump them to a cd and mail them to you. I thnk we had a cloud burst imediately over our house with limited daqmage elsewhere on the place. The ironic part is that we had just cleaned the yard of dead limbs and trees yesterday. My wife just read on facebook that Yettie Polk Park, in downtown Belton and about a mile and one-half east of us also had extensive damage of this nature.

Topic: 5581 Message: 5582

Joe, SORRY about your damage to your place.

We had only 1" of rain but the wind was blowing so hard that I don't see how it managed to get into the rain gauge, it hailed so much that after the rain and hail let up the ground was covered with about 2 1/2" of hail and some was as big as quarters. I wondered how much hail we really had? The rain washed out our driveway onto the County road. It all lasted about 10-12 minutes. Wind speed was a guess of about 65-75 mph. It was over real quick and was fortunate the repeater and ham equipment didn't suffer any damage due to the lightning strickes VERY close to our house and the repeater. I was also surprised that we didn't suffer any window breakage. Thanks to WINDOW WORLD.

I did not even have time to bring up the NWS on the repeater. I had gone to bed earlier and when it hit all I could think about was getting dressed.

From: <meseckem@...>
Topic: 5584 Message: 5584

Some people are reporting problems with being able to open either the pdf or doc bulletin files.

I have yet to figure it out.

I can open them on PCs running XP, Word 2007 and Adobe Reader 11, and Vista, Word 2010, and Adobe Reader 10.

The pdf was created using Word 2010 and the doc was saved as Word 1997-2003.
I am going to post another pdf file created a different way. Please try to open this one and let me know. It will be titled PDF TEST and be in the 2013 Bulletin folder.

5586. TARC December Holiday Dinner Party

Yahoo group: Temple_ARC
Date: 2013-11-18 14:03:08 UTC
From: John Hobson
Topic: 5586 Message: 5586

All.

This is a reminder that the TARC Annual December Dinner Party will be Friday, December 13 and not on our regular 1st Thursday meeting night. The date change is the result of a scheduling conflict.

Reservations are due no later than Wednesday, 20 November. Final dinner orders will be placed this week. Please respond to board@... with a number of attendees and your dinner choices. Dinner choices are chicken breast or pork chop steak. Each dinner reservation is $5 each. TARC covers the remaining cost for each reservation. We will again have live music during dinner.

Date: Friday, December 13
Time: 7PM, Your are welcome to arrive early to visit.
Location: Knights of Columbus Hall
2218 W Avenue D, Temple, TX 76504
Dress: Men: collared shirt, slacks or suite and tie. Women: dress or suit.

From: <meseckem@...>
Topic: 297 Message: 5588
Attachments: 2 described; binary payloads are missing from this source WARC

Instructions and map for those helping with the parade.

Bring HT and safety vest if you have them. Bring flashlight, pen or pencil. Clipboard if you want. Wear whatever you need to stay warm. Early forecast calls for mid to high 60s with a low of 45. Not bad for a parade.

Don't forget to be on site at 3:30 P.M.
Staging starts at 4:00 P.M. and barricades will be in place at that time.
Park in the lot behind the Bell County Health Department building that is located on 8th street between Barton and Calhoun avenues. This is the old school building.

Bring safety vest if you have one and something to write with.
We will operate Simplex on 146.52.

Got this in an email early today... Keep Johnny in your thoughts.

Johnny Paul WA5BGO- owner of Austin Amateur Radio Supply, suffered what has been described as a severe heart attack over the Thanksgiving Holidays.

Details are unclear, but he is at Austin Heart Hospital's ICU in an induced coma for a couple of days after which time doctors will be able to better assess his condition.

Family is nearby.

Please join us in prayers for Johnny, Grace and the rest of the extended family during this difficult period.

5597. A Late Christmas Gift From The Weather Nut At Dornville...

Yahoo group: Temple_ARC
Date: 2013-12-28 01:18:52 UTC
From: Joe Dorn, W5VEX
Topic: 5597 Message: 5597

BCC: my Weather Lists...

Merry Just After Christmas...

I have added several names of people that might have an interest for this mail out. For those folks: I have a mailing list that I use for weather related subjects especially prior to significant weather events. If you would like to be added to my list permanently I will be most happy to do so.

The mail outs include info direct from the severe storm meteorologists in Fort Worth (FWD) and Austin San Antonio (EWX). We are on the very southern edge of the FWD CWA (County Warning Area) and thus pay close attention to what is happening to our south in the EWX CWA.

We usually run an amateur radio SKYWARN net with connectivity to The National Weather Service in Fort Worth during severe weather events. The repeaters we use cover about 20 counties centered on Eddy Texas (the repeaters are at 1600 feet AGL about MM 315 on IH-35). Almost any radio scanner can receive the stations.

Now about the map, I use several programs during weather events but this one is beautiful because of its simplicity, understandability and price (free)... Sarah likes it because it is pretty...GRIN...

The map displays wind flow across the United States, thus you can easily see moisture sources (or lack thereof), frontal boundaries, and potential severe wind situations.

The data is updated at 5 minutes before the hour but you must manually refresh the display to get the latest info...

http://hint.fm/wind/

Hope you like it...

BTW, the 2014 NWS SKYWARN training classes are about to begin at a town near you if you would like to attend a good introductory class on severe weather. The price is right, prepaid with your tax dollars...

The NWS meteorologists put a lot of time and effort into these classes and it shows. The classes are very well received by folks just like you...

Schedule for FWD:
http://www.srh.noaa.gov/fwd/skywarnsch.php?file=sptrsch

Schedule for EWX:
http://www.srh.noaa.gov/ewx/skywarn/

FWD puts a lot more emphasis on the SKYWARN training since they cover the southern end of "Tornado Alley".

5602. TARC memberships for 2014

Yahoo group: Temple_ARC
Date: 2014-01-03 18:36:20 UTC
From: mah197018
Topic: 5602 Message: 5602

It is a new year and HAPPY NEW YEAR to you !
I have been elected to be the club treasurer again and will notify Myron of all membership payments done by check or PayPal and during Club Meeting attendance.

The board agreed and put before the club for approval a door prize policy for the year 2014. Anyone attending a club meeting during the 1st 90 days of the year will get a free membership for the year 2014.

You must be physically present to receive your 2014 membership at a meeting between January and March. A membership form must be filled out at the meeting showing your name, mailing address, and if you have one, a call sign and Email address (incase the board needs to contact you).

The suggestion was put before the club during the meeting and a vote taken to accept this for the year. Anyone having paid in advance will get a refund at the club meeting. If you have already paid for your 2014 membership, see the club treasurer at the February or March 2014 meeting and you will get a refund when the form is turned in for membership. Free membership is only available for those attending a meeting during the 1st 90 days of 2014, and must fill out the form, one by each person present. Spousal membership is only free if the spouse is present. Family membership is available if anyone in the family is present with the full member of the same family.

For those who can not make it to a club meeting, proceedures will continue as set forth in the club regulations. Membership for those receiving by attendance will be the same as those who paid (Senior, Full, Family and other) as far as voting rights are concerned.

Congratulations to those who were present at the January meeting!

Membership prices remain the same as last year for PayPal and Check payments. Age 65 and over still $15. Full membership $20. See http://www.tarc.org
for a copy of the club regulations.

5603. FW: Weather Update from National Weather Service -- Hard Freeze Next Monday/Tuesday

To: undisclosed-recipients:
Subject: Weather Update from National Weather Service -- Hard Freeze Next Monday/Tuesday

South Central Texas Partners...

...HEADLINE...Arctic air outbreak early next week -- coldest conditions since February 2011.

...AREA OF CONCERN...The entire area, but especially the Hill Country and low-lying locations in river valleys along and east of I-35 (such as Austin Bergstrom).

...IMPACTS...Low temperatures in the teens in the Hill Country, and lower to mid-20s most other locations in the early morning hours on Monday and Tuesday. Our safety tips revolve around the 4 P's: People, Pets, Plants, and Pipes. People and pets will need to be indoors Sunday night into Monday and Monday night into Tuesday. Expect spikes in the homeless seeking shelters. Plants should be brought indoors if possible. Covering plants may be effective for hardier types, but may not work in some cases with temperatures below freezing for 10-14 hours each morning. Pipes are a concern in the Hill Country or in exposed situations such as mobile homes

near rivers or streams. Usually 9 consecutive hours of temperatures at or below 21 F is enough for unprotected pipes to burst. Covering outdoor faucets, opening up indoor cabinets for warm air flow under sinks, flushing the water out of sprinkler systems, and wrapping exposed pipes offer protection.

...TIMING...Temperatures will be below 28 F from midnight until 10 am both Monday and Tuesday mornings.

...DISCUSSION...A strong cold front will usher in the coldest air since February 2011 into the region. It will be much worse for locations in the northern half of the U.S. -- be glad we live in Texas. Temperatures will fall well below freezing and stay there for 10-14 hours both Monday and Tuesday mornings. There will not be much wind (especially Tuesday), but wind chills will still fall into the single digits in the Hill Country to the lower teens elsewhere. People should at minimum wear hats, even better wearing gloves or mittens and covering their face (a handkerchief tied off in bank robber style works well). Hypothermia and frostbite should only be a problem with many hours of outside exposure. We have a summary image below.

Here is the Sunday afternoon update from San Antonio NWFO. I still have not received anything from Fort Worth and their site has been, shall we say, a little 'bouncy' with wind chills being listed without the projected still air temperatures and the projected lows changing from hour to hour.

At any rate it is going to be 'Yankee Winter Weather' cold and I am ready for it to get out of Texas.

5606. The Weather Channel might not be on Direct TV Tuesday morning...

Yahoo group: Temple_ARC
Date: 2014-01-14 01:55:09 UTC
From: Joe Dorn, W5VEX
Topic: 5606 Message: 5606

BCC: my lists

I picked this up on The Free Republic Forum yesterday....

The Weather Channel might not be on Direct TV Tuesday morning...

The Weather Channel is trying to get an increase in their fees from DTV, follow the link below for details.

They stopped being a valid source of weather info after NBC took them over a few years back.

I found out that DTV has activated another weather 24/7 service, Weather Nation, on channel 361. It is not yet as smooth as the Weather Channel in its delivery but it is 24/7 weather and not a bunch of documentaries or liberal talking points.

I am checking Weather Nation out and hope that it fills the agenda that the old Weather Channel used to have...

http://www.freerepublic.com/focus/f-news/3110976/posts

********** My comment on Freerepublic.com **********

To: UB355

'Skywarn.org has chapters throughout the country. These are the weather spotters and you can listen to their reports on local radio frequencies.'

I am one of the net control operators for the SKYWARN group in Central Texas. Our 'spotters' have direct communications with the NWS in Fort Worth. I usually start preparing for a major event several hours ahead of time and the Weather Channel USED to be one of my sources. Since NBC took it over, it is a waste of time to even check it since it usually has some rerun of a weather related video running during tornado outbreaks.

The good folks have mostly gone elsewhere and have been replaced with politically correct personalities. I don't know how Jim Cantore has survived; he is married and has kids and also is a damn good OCM...

We, wife and I, used to have the Weather Channel on as background noise 24/7. It has been replaced by Fox News until Bill O'Riley comes on. (I try to remember to turn it back on when Megan Kelly comes on.)

Also all of the other news channels usually have stand-in-the-wind-and-pseudo-yell personalities on during major events and they are more attractive...

I had not heard of the other weather source on DTV...

BTW, if you are in a storm prone area of the country, get a scanner and/or a Weather Radio (I recommend a Midland WR-300, available at most outdoor related merchants and Amazon.com: I am adding two more to my outpost.)

You can check with a local amateur radio operator or TV station to find out where the SKYWARN nets are being run.

As an aside ALL USA WEATHER DATA STARTS WITH THE NWS. The networks, TV and radio stations just massage the data and try to make it more 'exciting'.

With a weather radio, you get the latest info from the NWS. We, the SKYWARN participants, furnish 'ground truth' and validation to what they see with their tools. (By the time a radar beam hits a reflector at 75 miles it is 8000 feet above the ground, most tornadic activity is at less than two thousand feet: our eyes can see what the radar can't.)

Topic: 5607 Message: 5607

I-35 expansion construction has resulted in lane closures in front of Western Hills Church of Christ.

There is no longer access to the Church from General Bruce Dr (frontage road).
You will have to enter from Airport Road.

From Airport take N 43rd street. Purvis Industries is located at this intersection.
It connects with Church St which leads to the parking lot behind the Church.

Work may be completed in a couple of months but for the February and March meeting plan on using Airport Road.

Subject: NWS Update: Potential Winter Weather for Central Texas Thursday Night

Good afternoon,

While we've all enjoyed the balmy weather over north and central Texas over the past several days, changes are coming. An arctic cold front will sweep through most of Texas on Thursday, ushering in much colder air across the state. In conjunction with this frontal passage, a fast moving upper level storm system will move east across the state late Thursday into Friday morning, triggering a chance of winter precipitation across the central and southeast counties. While impacts - at this time - are not expected to be significant in the WFO Fort Worth County Warning Area, we wanted to give you a heads up on this change in the weather pattern. Please see the attached slides for a graphical representation of the impacts.

BOTTOM LINE: There will be a chance of light snow or sleet Thursday evening through Friday morning, south of an Eastland to Waco to Centerville line. This storm system will be fast moving, so the duration of any winter precipitation will be just a few hours. Accumulations, if any, should be very light. However, with surface temperatures falling into the 20s by Friday morning, any brief bursts of snow or sleet that do occur might have

the potential to cause some isolated slick spots, mainly on elevated surfaces.

AMOUNTS AND AREAS OF GREATEST CONCERN: Light snow or sleet is possible generally south of an Eastland to Centerville line. In much of this area, accumulations, if any, would be extremely light - just a dusting. South and west of an Eastland to Temple line, there is a slightly higher potential for accumulation, perhaps approaching 1/4" in spots.

TIMING: From 4 pm Thursday afternoon, to 9 am Friday morning.

IMPACTS: Isolated slick spots, mainly on bridges and overpasses.

FORECAST CONFIDENCE: Low to moderate on occurrence of snow/sleet; If it does occur, moderate to high confidence on amounts

ALTERNATE SCENARIOS: While very unlikely, there is a small chance that accumulations could exceed our current expectations where brief bursts of snow or sleet occur. If this were to occur (again, very unlikely), then conditions would become more slick and hazardous in a few locations.

To: undisclosed-recipients:
Subject: Possible Winter Precip Thursday evening into Friday Morning.

South Central Texas Partners...image attached.

...HEADLINE...Chance of winter precipitation, including light snow, across much of South Central Texas Thursday evening into Early Friday.

...AREA OF CONCERN...Possible light winter precip accumulations north of a line from Del Rio to San Antonio to Schulenburg. A wintry mix of precip is also possible elsewhere (Rio Grande and Coastal Plains) but we are not looking at accumulations at this time.

...IMPACTS...Could see some light icing mainly on bridges and overpasses . Other less traveled roads could also see some light accumulations and icy conditions. The early morning commute on Friday morning may be impacted. Cold temperatures will be in place Thursday and Friday...with highs some 30-40 degrees cooler than what we saw on Monday.

...TIMING...Mainly 6pm Thursday to 6 am Friday morning. The area of concern will shift southeast early Friday so areas to the southeast will possibly have effects that last longer through Friday Morning.

...DISCUSSION...
Another strong cold arctic front is headed our way and will push into South Central Texas likely during the predawn hours Thursday morning. High temps

on Thursday may in fact come during the morning as the cold air moves in during the day with temperatures staying in the 30s and 40s during the afternoon. A weak disturbance is coming out of the Rockies and will move over Texas Thursday night into early Friday. While the chances are not great...forecast models continue to develop some precipitation with this system...albeit...totals are not very high...generally about a tenth of an inch or lower. The problem is that the arctic air will continue building down into the area Thursday night and early Friday dropping temps below freezing...setting the stage for possible winter precipitation starting Thursday afternoon in the Hill Country...and spreading east and southeast Thursday night into early Friday. Temperatures are expected to fall below freezing across all of South Central Texas by around Midnight late Thursday night.

The atmosphere looks to be cold enough to maybe even see some snow mainly across the northern half of the area...north of a line from Del Rio...to San Antonio...to Schulenburg. At this point about 36 hours out...we are calling for some sleet and snow mix. This best chances to see some accumulations are in the Hill Country where we are currently forecasting around 1/4 inch of accumulation of snow. So we are talking maybe a little more than a dusting.

With the ground being so warm because of our near record temps yesterday...I dont think we will see widespread icing problems. I do think the best chances of seeing accumulations will be on grassy surfaces, bridges, overpasses, and less traveled roads. Being that this system is coming out of the Rockies and is fairly dry to begin with, I am fairly confident that the overall amount of precipitation will be light. My confidence is much lower however on whether we may see freezing rain, sleet, or snow. Right now we are pointing toward light sleet and light snow. Temperatures are expected to climb above freezing by Friday afternoon so if this event does occur...it should be be quickly gone by the afternoon.

This is just the first email...more to come Wed and Thu. Watch the forecast closely as things can change rather dramatically based on the latest weather information and forecast models. Responders need to start looking at possible staffing Thurs night into Friday. With the overall chance of precipitation only 30-40%...this is by no means a "slam dunk" sure thing event. Its still way early in this event...and hopefully over the next 24 hours we can fine tune the forecast and get more confident in what we will likely see or not see.

To: undisclosed-recipients:
Subject: Issued 400 pm Wed 22 Jan 2014 : Winter Weather Event Outlook for Thursday/Friday

South Central Texas Partners...

...HEADLINE...A mix of light sleet, snow, and freezing rain, across all of South Central Texas from 6 pm Thursday to 2 pm Friday.

...AREA OF CONCERN...Winter precipitation accumulations on elevated surfaces north of a line from Del Rio to San Antonio to Schulenburg. A wintry mix is expected elsewhere (Rio Grande and Coastal Plains) but we are not looking for significant accumulations at this time.

...IMPACTS...Light icing from sleet and snow mainly on bridges and overpasses, and anything where the object will be the same as the air temperature (e.g., car roofs and windshields). Roads will generally be ok since the warm ground will melt the falling precipitation. However, less traveled roads in the Hill Country and Williamson County could also see some light accumulations and icy conditions. The late evening commute (after 6 pm) could be impacted Thursday evening. The morning commute on Friday morning will be significantly impacted. Cold temperatures will be in place Thursday and Friday...with highs only in the 30s to low 40s and wind chills in the teens and low 20s.

...TIMING...Mainly 6 pm Thursday to Noon Friday. Some concern in the Coastal Plains east of I-35 until 2 pm Friday afternoon.

...DISCUSSION...
Another Arctic cold front will move through South Central Texas a few hours

either side of sunrise Thursday morning. High temperatures on Thursday will occur during the morning, then temperatures fall through the day as the cold air moves in, staying in the 30s and 40s during the afternoon. A weak disturbance will move out of the Rockies and across Texas Thursday night into Friday. While precipitation will be light, the forecast models match our experience with these systems, indicating winter precipitation starting Thursday afternoon in the Hill Country, and spreading southeast Thursday night into Friday. Temperatures are expected to fall below freezing across all of South Central Texas before midnight Friday morning.

We expect a mix of sleet and snow, with accumulation mainly across the northern half of the area...north of a line from Del Rio...to San Antonio...to Schulenburg. This best chances to see accumulations are in the Hill Country and Williamson County where we are currently forecasting around 1 inch of accumulation of snow. Other areas should only see a dusting. Temperatures are expected to climb above freezing by Friday afternoon so if this event does occur...it should be be quickly gone by the afternoon.

Graphics for Thursday and Friday are below.

5613. Temple to Open Emergency Warming Centers

Yahoo group: Temple_ARC
Date: 2014-01-24 00:44:03 UTC
From: <kevinmccoy@...>
Topic: 5613 Message: 5613

The Temple Office of Emergency Management (OEM) is activating the Emergency Warming Center Plan starting Thursday to provide a temporary warming space for homeless or distressed persons in the city. This decision is based on data from the National Weather Service on the sustained nighttime predicted wind chill factor.

Warming Center locations are:
· Victory Ministries, 305 South 18th Street (men)
· Transformation Station, 503 East Central Avenue (men)

Resources are available to provide a warming location for women and children should the need arise. The warming centers will be open Thursday, January 23 through Friday, January 24, 2014 from 5:00 p.m. to 9:00 a.m.

Warming centers are possible due to the efforts of the City of Temple Office of Emergency Management (OEM), the not-for-profit Temple Emergency Warming Center Coalition (TEWCC), and the 2-1-1 System.

Warming Centers in Temple provide a place to bring people that would normally be out in the elements on an extremely cold evening indoors during the coldest hours of the night. Warming Centers provide a warm area for refuge, water, blankets, toilet facilities, and limited hygiene items.

Once e activated, information on warming centers is available by contacting 211.

Sent: Saturday, January 25, 2014 4:44 PM
To: undisclosed-recipients:
Subject: Issued 445 pm Sat 25 Jan 2014 : Winter Weather Event Outlook for Tuesday/Wednesday

South Central Texas Partners...

...HEADLINE...A mix of light sleet, snow, and freezing rain, across all of South Central Texas Tuesday through late Wednesday night.

...AREA OF CONCERN...Winter precipitation accumulation on elevated surfaces and less traveled roads.

...IMPACTS...Strong, gusty winds behind the cold front on Monday -- a wind advisory is likely. For the late evening to mid-morning hours from early Tuesday through late Wednesday night: light icing from freezing rain, sleet, and snow mainly on bridges and overpasses, and anything where the object will be the same as the air temperature (e.g., car roofs and windshields). Less traveled roads could also see some light accumulation and icy conditions. Cold temperatures will be in place Tuesday and Wednesday, with highs only from the mid 30s to low 40s.

...TIMING...6 am Tuesday to midnight Wednesday, possibly into the hours before sunrise on Thursday.

...DISCUSSION...
Another Arctic cold front will move through South Central Texas Monday morning. High temperatures on Monday will occur during the morning, then temperatures will fall through the day as the cold air moves in. An upper level low will move across Texas Tuesday and Wednesday. While the chance for precipitation are small and the amounts will be light, forecast indicate

another mix of wintry precipitation from roughly 9 pm to 9 am on Tuesday and Wednesday. We expect a mix of sleet and snow, along and north of U.S. Highway 90, with a mix of freezing rain and sleet south of U.S. 90. Temperatures will climb above freezing during the daytime hours on Tuesday and Wednesday, so precipitation falling then would be rain.

Another update from EWX on this weeks miserable weather,,,

I have not seen any thing from Fort Worth yet.

The different weather offices do not step on each others toes as a rule and do not project into the adjacent CWA's; EWX thus does not say anything about the areas north of Williamson County. The end of their line "along and east of the Balcones Escarpment from Hondo to New Braunfels to Georgetown." does not include Belton 30 miles from Georgetown and the Balcones Escarpment runs on the east end of our place along loop 121 just inside the Belton city limits. Currently the NWS is projecting 22 degrees for Dornville Tuesday night.

Check;

http://www.srh.weather.gov/fwd/

And then:

http://forecast.weather.gov/MapClick.php?map.x=162
<http://forecast.weather.gov/MapClick.php?map.x=162&map.y=234&site=fwd&zmx=1
&zmy=1#.UuXQIvvnY1I> &map.y=234&site=fwd&zmx=1&zmy=1#.UuXQIvvnY1I

I am totally tired of this stuff, come on spring!!!

As an aside, the winter moisture and seeds left over from the previous dry years has set us up for a spectacular wildflower display this year; we are absolutely covered with Bluebonnet seedlings.

Subject: Issued 445 pm Sun 25 Jan 2014 : Winter Weather Event Outlook for Tuesday/Tuesday Night

South Central Texas Partners...

...HEADLINE...A mix of freezing rain, sleet, and snow, mainly Tuesday morning and Tuesday night.

...AREA OF CONCERN...Along and east of U.S. 83 Tuesday morning, along and south of U.S. 90 Tuesday night.

...IMPACTS...A strong cold front will bring gusty winds of 20 to 35 mph to many locations by mid-morning Monday -- a wind advisory is possible along and east of the Balcones Escarpment from Hondo to New Braunfels to Georgetown. A weak disturbance may produce snow flurries along and north of a line from Fredericksburg to San Marcos to Taylor (including Metro Austin) from midnight to 6 am Tuesday. Otherwise, a mix of light freezing rain...sleet...and snow is possible until 11 am Tuesday, then a change to cold rain Tuesday afternoon, before a change back to the mixed precipitation after 7 pm Tuesday. Precipitation should end for locations north of U.S. 90 by 6 pm Tuesday, but continue at locations south of U.S. 90 until 6 am Wednesday. The main concern will be slippery spots on bridges, other elevated roadways, and any object air can get underneath (e.g., cars, decks). Cold temperatures will be in place Tuesday with lows in the 20s and highs only from 35 to 40.

...TIMING...6 am to 6 pm Tuesday, but extending until 6 am Wednesday south of U.S. 90.

...DISCUSSION...
Another Arctic cold front will move through South Central Texas Monday morning. High temperatures Monday will occur during the morning, then temperatures will fall through the day as cold air moves in. An upper level low will move across Texas on Tuesday, bringing slight chances for precipitation. We expect a mix of light freezing rain, sleet, or snow Tuesday morning. Temperatures will climb above freezing during the daytime hours on Tuesday, producing cold rain, but then temperatures will go back below freezing after 7 pm Tuesday, bringing a return of the mix of light freezing rain, sleet, and snow. While temperatures will be cold enough for wintry precipitation, coverage will be scattered and amounts light, so only minor impacts are expected at this time.

From: Tom Bradshaw - NOAA Federal [mailto:tom.bradshaw@...]
Sent: Monday, January 27, 2014 5:09 PM
To: undisclosed-recipients:
Subject: Update from NWS Fort Worth/Dallas concerning winter weather potential tonight

Good afternoon,

This is just a quick winter weather update....mainly for our partners in the southern portion of the WFO Fort Worth/Dallas warning area...

BOTTOM LINE: A fast moving upper level storm system will combine with the cold airmass in place across central Texas to create a chance of sleet and light snow tonight south of a Goldthwaite - Hillsboro - Canton line. Right now, we don't expect any significant accumulations or impacts across the great majority of this area. However, some bridges and overpasses in Bell, Milam, Robertson and Leon Counties might experience just enough of a dusting to create a few icy spots by daybreak Tuesday. Please see the attached map depicting impact areas.

Please note: A somewhat sharp divide in accumulations and impacts may develop across central Texas overnight. NWS Offices Austin/San Antonio and Houston have issued advisories and even winter storm warnings for groups of counties immediately south of the Fort Worth forecast area. Right now, we believe these significant impacts will remain south of Bell, Milam Robertson, and Leon.

Emergency managers and other public safety and government officials in these areas should stay abreast of the weather situation this evening and

overnight, and be ready to take appropriate actions if icy spots do develop.

AMOUNTS AND AREAS OF GREATEST CONCERN: A light accumulation of snow or sleet is possible generally south of a Temple to Buffalo line. Some spots in this area could receive up to one quarter inch accumulation by daybreak Tuesday.

TIMING: Mainly from midnight tonight through 8 am Tuesday morning.

IMPACTS: Isolated slick spots, mainly on bridges and overpasses.

FORECAST CONFIDENCE: Low to moderate on occurrence of snow/sleet; If it does occur, moderate to high confidence on amounts

ALTERNATE SCENARIOS: While unlikely, there is a very small chance that accumulations could exceed our current expectations where brief bursts of snow or sleet occur. If this were to occur (again, very unlikely), then conditions on both bridges and some roads could become more slick and hazardous in a few locations south of a Lampasas to Palestine line.

Subject: NWS Fort Worth Update on Sunday Winter Weather Potential

Good morning,

There will be a potential for wintry precipitation across parts of north Texas on Sunday.

A mixture of rain, freezing rain, sleet and snow is expected in areas north of a line from

Eastland to McKinney to Paris. The attached graphic depicts the primary areas that may

be affected.

At this time, temperatures across nearly all of the Dallas - Fort Worth metroplex are expected

to remain just above freezing when most of the precipitation falls. A brief period of light freezing rain or sleet will be possible Sunday near and just northwest of Fort Worth, but no significant impacts are expected. A few ice pellets could also mix with the rain at times on Sunday across

any part of Dallas or Fort Worth, but again, little or no impacts to roadways are expected in the

DFW area at this time.

For the Waco, Temple, and Killeen areas, there will be a chance of rain on Sunday but no freezing or frozen precipitation is expected at this time.

IMPACTS

Where winter precipitation occurs, some icing on roadways can be expected. Bridges and

overpasses will be the first to be impacted, and other major roadways could also become slick

in areas that receive a period of steady sleet.

TIMING

The primary timing for winter weather impacts will be from 8 AM Sunday to 8 PM Sunday.

Precipitation is expected to dissipate from west to east Sunday evening; however, any roads

that are slick Sunday afternoon may remain slick and hazardous through Sunday night as

temperatures remain near or below freezing.

ADDITIONAL SCENARIOS

If temperatures are colder than expected, and the freezing line is farther south than currently

forecast on Sunday, then impacts from the winter precipitation will be farther south than

currently forecast. Colder temperatures would also mean more significant and widespread

impacts in the counties that border the Red River.

BOTTOM LINE

Parts of north Texas will likely be impacted by wintry precipitation on Sunday. There is still

uncertainty on the exact location and severity of the impacts. The attached graphic depicts

the most likely scenario at this time. If you are in an area within or just south of the areas

outlined on the graphic, please stay tuned to the latest forecast updates through the weekend.

Subject: NWS Winter Weather Update

Good morning,

We're looking at two winter precipitation events across north and central Texas today. In the northern counties, additional snow is possible. Farther south, freezing drizzle is a concern...mainly this morning. Both areas pose concerns for travel, and I'll focus on each of them below. Please see the attached graphics for additional details.

BOTTOM LINE:

Light snow is expected in areas generally along and north of a Comanche-Cleburne-Sulphur Springs line through mid afternoon today. This system is weaker than the one we experienced Thursday, so overall amounts should be quite light - generally 1/10" to less than 1/2 inch. While this snowfall could produce some (new) slick spots, we don't believe the road impacts will be close to what we received Thursday.

However, there will likely be a band of heavier snow within this broad area - and we believe this will produce some locally higher amounts of at least 1 inch. The most likely area where this heavier band will set up is in Young, Jack, Montague, Wise, Cook and Grayson Counties through 2 pm. Within these areas, you can likely expect some additional snow packing and icy conditions - comparable to what was experienced on Thursday. Please understand that there is some uncertainty in the exact location, duration and intensity of this heavier band, so jurisdictions to the immediate south of these counties should also remain alert for the possibility of locally greater impacts than

we currently expect.

Farther south, we are currently experiencing freezing drizzle in many areas south of a Goldthwaite to Hillsboro to Athens on Friday. This will likely expand in coverage and persist through the mid afternoon hours. With temperatures generally in the mid to upper 20s this morning, we expect ice to form on many bridges, overpasses, and surface roadways during the next few hours. While liquid amounts will be quite light, we do expect slick conditions to develop and persist through the day. Travel could become seriously impeded in many areas south of this line today.

For those counties that lie between the two precipitation areas I've outlined, you can expect some light snow, primarily, though some light freezing drizzle is also possible through midday. At this time, we don't believe the amounts will be significant enough to produce appreciable travel impacts. However, this is another area of uncertainty, due to how these systems - and their moisture sources - unfold. If you're a jurisdiction in one of theses counties, please stay alert for the possibility of some light winter precipitation through midday, which may produce some minor slick spots.

Emergency managers, elected officials, and other partners need to be aware of the impacts anticipated with both the snow event, and the freezing drizzle. This comes in addition to residual icy patches that still exist in areas along and north of Interstate 20 due to today's snow.

TIMING: Snow in the north should taper off and mostly end by 3 pm. The freezing drizzle - which may transform to plain liquid drizzle in the far SE counties by afternoon (where temps rise to near freezing), will likely taper from west to east this afternoon, but will linger in areas east of I-35 into the evening hours.

I will do my best to get another e-mail out by 1 pm. In the meantime, please don't hesitate to call or e-mail if you have any questions. As always, please don't hesitate to contact us if you have any questions.

Thanks,

Tom

From: Jon Zeitler [mailto:jon.zeitler@...]
Sent: Monday, February 10, 2014 5:16 AM
To: undisclosed-recipients:
Subject: 515 am Mon Feb 10th : Winter Weather Outlook for Tonight through Tuesday Evening from NWS

South Central Texas Partners....

...HEADLINE...Another chance of light freezing rain Tonight through Tuesday evening.

...AREA OF CONCERN...The Hill Country and northern Edwards Plateau from 12 am through noon Tuesday, and locations along and north of Interstate 10 (but not Bexar County) from 6 pm Tuesday to 12 am Wednesday.

...IMPACTS...Light ice accumulation possible on bridges, flyovers, and some roads. Exposed surfaces where cold air can get underneath
(e.g., cars, decks) may also see light icing. Travel may be impacted, but no other impacts (e.g., tree or power line damage) are expected.

...TIMING...Temperatures will fall through the day and drop below freezing after 12 am Tuesday across the northern Edwards Plateau and Hill Country. Additional rain is expected during the day Tuesday, but temperatures will be above freezing. Temperatures will fall below freezing again Tuesday evening, putting locations along and north of Interstate 10 (but not Bexar County) at risk for freezing rain before all precipitation ends at 12 am Wednesday in our area.

...DISCUSSION...
An Arctic cold front will move out of our southern counties by sunrise, bringing cold conditions through Wednesday morning. Moist Gulf air lifting over the low-level cold air will produce drizzle or light rain today and tonight. A weak upper level trough will pass over Texas on Tuesday, bringing

even better chances for light rain. Temperatures will fall below freezing at higher elevations in the northern Edwards Plateau and Hill Country between 12 am and noon Tuesday. Temperatures are expected to drop below freezing for locations along and north of Interstate 10 after 6 pm Tuesday evening. Any precipitation that falls when the ground temperature is below freezing is likely to stick and cause light icing.

Our confidence that freezing temperatures will be in place is HIGH. Our confidence on the amount of precipitation is MODERATE. South Central Texas needs to be ready to respond again to frozen precipitation. Again, the main impact will be on travel, with light icing possible on bridges, flyovers, and lightly traveled roads. The next update will be sent this afternoon.

To: undisclosed-recipients:
Subject: 930AM Weather Update...a few reports of sleet are possible today

South Central Texas Partners...

...HEADLINE...Cold rain across most of South Central Texas. A few reports of sleet are possible.

...AREA OF CONCERN...A few reports of sleet mainly north of Highway 290.

...IMPACTS...No expected impacts at this time. A worse case scenario of a heavy sleet shower could produce a quick light accumulation of sleet. The chances of this remain very slim. Temperatures across the region are expected to remain above freezing this morning and afternoon.

...TIMING...This morning through early afternoon. 9am through 3 pm.

...DISCUSSION...A cold airmass is in place with temperatures ranging from the mid 30s over the Hill Country...to the lower 40s elsewhere. Temperatures should hold steady or drop slightly through the day. We are not expecting temperatures to drop below freezing across any widespread areas at this time. An area of light rain showers, occasionally mixed with a heavier shower or isolated thunderstorm will bring some welcome rains across mainly the southern 2/3rds of South Central Texas...mainly south of Highway 290. Rain totals will average around 1/4 inch in some spots...around 1 inch in a few isolated spots.

In areas mainly north of Highway 290...precipitation is not very heavy...but the atmosphere is cold enough that we may get a few reports of sleet. It should be light enough that significant accumulations are not expected...but will continue to monitor the situation and issue an advisory if warranted.

All the precipitation should come to an end by mid to late afternoon.

You can see the latest forecasts and watches/warnings/advisories by going to the Austin-San Antonio National Weather Service website at <http://www.weather.gov/austin> www.weather.gov/austin

To: undisclosed-recipients:
Subject: NWS Fort Worth Update: Drastic Weather Changes coming

Good afternoon,

After two warm days (today and Saturday), a very strong Arctic cold front will bring drastic weather changes to the area, with some potential for severe thunderstorms and wintry precipitation.

The attached presentation gives additional details on the timing and location of the potential weather impacts on Sunday and Sunday night.

BOTTOM LINE: Public safety and transportation officials should closely monitor the forecast for any changes. At this time, we think there is a potential for freezing rain and freezing drizzle that could lead to more widespread impacts than we are expecting from the isolated severe thunderstorms. All areas will receive gusty north winds and drastically colder temperatures with the Arctic front Sunday into Sunday night. Wind chill readings will fall into the single digits in the north and teens elsewhere Sunday night.

IMPACTS, AMOUNTS, AND AREAS OF GREATEST CONCERN: The area with the greatest potential for impacts from the freezing rain or freezing drizzle will be areas along and north of a line from Comanche to Canton. Slick spots on elevated roadways will be possible and even some major roadways could be impacted if steady light freezing rain or freezing drizzle can persist when temperatures fall to around 28 degrees.

The ice accumulation is expected to remain below one tenth of an inch in all areas. Therefore, widespread impacts to trees and power lines are not currently forecast. However, with gusty north winds expected to persist into Sunday night, even a light coating of ice on trees and power lines could cause problems.

TIMING: Isolated severe thunderstorms will be possible along or just ahead of the advancing Arctic front on Sunday. The onset of freezing precipitation will be tied to the freezing line, which will advance from the Red River area Sunday morning into the Waco and Athens area by Sunday evening.

FORECAST CONFIDENCE: For isolated severe thunderstorms, the forecast confidence is low since the rapidly advancing cold air should tend to inhibit thunderstorm intensification. For the wintry weather impacts, the confidence is moderate.

ALTERNATE SCENARIOS: There is a wide range of possibilities, but there are no indications that the wintry precipitation will be drastically heavier than forecast. There is also the potential for precipitation to end quickly after the cold air arrives with minimal impacts to roadways.

Sent: Monday, March 03, 2014 5:01 PM
To: undisclosed-recipients:
Subject: Weather Update at 5 PM Monday March 3

South Central Texas Partners....(briefing slides are attached)

...HEADLINE...A Winter Storm Warning is in effect for locations along and north of Texas Highway 71
(Llano, Burnet, Williamson, Travis, Bastrop, Lee, Fayette)...and a Winter Weather Advisory is in effect for (Gilliespie, Kerr, Blanco, Kendall, Hays, Comal, Bexar, Caldwell, Guadalupe, Wilson, Gonzales, Karnes, DeWitt, Lavaca). These warnings and advisories are in effect from 8pm tonight until Noon Tuesday.

...AREA OF CONCERN...The entire area along and north of Interstate 10, including Metro San Antonio, Austin, and including the coastal plains of Texas southeast of San Antonio. Special concern for areas along and north of Texas Highway 71 including Metro Austin. If Texas 71 or Interstate 10 pass through the county where your home, business, or jurisdiction is located, assume the entire county has the potential for winter weather tonight into Tuesday morning.

...IMPACTS...Significant travel impacts are possible in the Winter Storm Warning area, including the possibility of ice accumulation on bridges, overpasses, and roads. Up to 1/10th of an inch of accumulation is possible. No major damage (e.g., tree or power line damage) is expected.

Across the Advisory area...light ice accumulation (trace amounts) are possible on bridges, flyovers, and some roads. Exposed surfaces where cold air can get underneath (e.g., cars, decks) may also see light icing. Some travel delays can be expected as some bridges/overpasses may be closed.

Thunderstorms may be possible overnight which could lead to isolated higher totals of ice and/or sleet. There is no threat for the Monday evening commute. There is a high likelihood of major impact on the Tuesday morning commute....thus the issuance of the advisories and warnings. There is no threat for the Tuesday evening commute.

...TIMING...Precipitation is expected to start between 8 pm and midnight, reaching peak intensity from midnight through sunrise Tuesday, then taper off by mid-morning Tuesday. Main impact time will be from Midnight through 10 am. Temperatures will warm above freezing by noon Tuesday across most of the region, and melting of any ice on roads should be quick.

...DISCUSSION...
Another Arctic air mass is in place across South Central Texas. A disturbance coming from the Southwest U.S. will lift moist gulf air over the cold air and produce a combination of freezing rain and sleet across the area tonight and early Tuesday. Significant accumulation (up to 1/10th of an inch) of the freezing rain and sleet is expected along and north of Texas 71, including Metro Austin. Roads may be treacherous from midnight through noon Tuesday. All unnecessary travel in this Warning area should be delayed or cancelled overnight into Tuesday morning. Elsewhere across the I-10 Corridor...a light ice buildup may occur across the Advisory area, causing travel headaches and delays overnight into Tuesday as mainly bridges and overpasses get impacted.

Temperatures are expected to warm above freezing by noon across South Central Texas so any ice that does form will likely melt by the noon hour.

Our confidence that freezing temperatures will be in place is 100% across the Warning and Advisory area. Our confidence on the amount of precipitation is MODERATE to HIGH. South Central Texas needs to be ready to respond again to frozen precipitation. Again, the main impact will be on travel, with icing possible (Advisory area) and likely (Warning area), especially on bridges, flyovers, and lightly traveled roads.

You can monitor the latest forecasts and watches/warnings/advisories from the Austin-San Antonio National Weather Service on our webpage: <http://www.weather.gov/austin> www.weather.gov/austin

BCC: VE list

It's that time again...The next edition of the TARC Ham Expo will occur on March 29th and I will need at least 10 VE's to assist in giving the amateur radio tests...

Note: This a little earlier than the usual April date...

I will set up at 9:30 and start the testing at 10:00 at the same location in the main building...

If you can assist please let me know...

You get free admission to the EXPO by showing your VE badge. There are no fees to enter the test location.

All ARRL VE's are welcome to participate...

Thanks...

Subject: NWS update: Severe Storms Possible on Saturday

Good afternoon,

This is just a short note to let you know of the potential for strong to severe thunderstorms

on Saturday afternoon and evening, March 15.

The attached graphic highlights the parts of north and central Texas that will have the greatest

potential for severe thunderstorms. Large hail, damaging winds, and an isolated tornado will all be possible.

At this time, the event on Saturday is not expected to be particularly widespread. However,

it may be the first severe weather episode of the spring. With festival season starting and an increasing number of outdoor activities planned, we thought it would be a good idea to highlight the potential starting today.

There are still uncertainties with regard to the forecast details on Saturday. Friday night and Saturday morning showers and thunderstorms are not expected to be severe; the severe weather potential will generally be from 2 pm to 10 pm on Saturday.

We will send another email update on the severe weather potential on Friday afternoon.

Greg Patrick

NWS Fort Worth

From: Greg Patrick [mailto:gregory.patrick@...]
Sent: Friday, March 14, 2014 12:24 PM
To: undisclosed-recipients:
Subject: NWS UPDATE: Severe Weather Potential Saturday

Good afternoon,

After a mild and quiet Friday afternoon, scattered to numerous thunderstorms are expected to affect north and central Texas on Saturday. Beneficial rainfall is expected in many areas, but we will also have to deal with the threat of strong to severe thunderstorms.

A short presentation is attached that maps out the locations that we think have the greatest threat of severe weather on Saturday.

BOTTOM LINE: Emergency Managers and other public safety officials should be prepared for the potential for severe thunderstorms Saturday afternoon into Saturday evening. Large hail and damaging winds will be the primary threats with any severe thunderstorms, and an isolated tornado is possible in areas along and west of I-45 and along and south of I-20. Closely monitor our web page or other sources of weather information for updates through Saturday afternoon.

OVERVIEW: A dryline, cold front, and upper level system will affect the area this weekend. Scattered to numerous thunderstorms are expected to develop, mainly along and ahead of the cold front on Saturday. A few of the storms could be severe on Saturday afternoon and evening before the cold front brings cooler and more stable air to all areas by late Saturday night and early Sunday. The greatest rainfall totals will be in northeast areas

around Sulphur Springs and Paris where over one inch of rain is possible. The greatest severe weather potential will be in southern and western areas where instability will be greatest.

TIMING: Severe thunderstorms will be possible Saturday afternoon and evening, roughly from 2 PM to 10 PM. Thunderstorms with a lightning threat are possible at other times this weekend, including Saturday morning and also Sunday, but severe weather is not expected outside of the Saturday afternoon and evening time period.

IMPACTS: Hail up to 1.5 inches in diameter and damaging thunderstorm wind gusts over 60 mph will be the primary impacts. An isolated tornado will be possible in the southern and western areas where the best combination of instability and vertical wind profiles leads to a potential for sustained (supercell) thunderstorms.

FORECAST CONFIDENCE: Moderate to high confidence on the occurrence of isolated severe thunderstorms. There is low to moderate confidence on the locations and timing of the greatest severe weather potential, and an overall low confidence on the tornado potential.

ALTERNATE SCENARIOS: There is a chance that showers and thunderstorms become widespread early in the day on Saturday and limit the severe weather potential for later in the day. Conversely, if morning showers and thunderstorms either do not develop or dissipate quickly, the greater instability in the afternoon could lead to a greater coverage of severe thunderstorms.

Hi Joe

Okay August is our traditional launch date, in the early days Andy and the guys decided to do this then because the winds were favorable for a VERY HIGHT Altitude flight and easy recovery. They tried launches all times of the year and the best results were always August. They decided to concentrate efforts on that month and do it every year. With the exception of 2002 (because of security reasons from 911) the guys have put up a balloon every year at that time.
The site is the Wharton Texas Airport, it's a small one with a nice site and they are friendly to all aviation types. Have you ever seen a Para Plane? It's a sort of ultra light that uses a big parachute as the wing. They build them there and you can get a fun ride on one for $20.00 they are safe and well built. They carry either 1 or 2 people. They let us use their hanger to fill the balloon. I sometime volunteer to hold the balloon while filling it. It's a just in case thing Helium and those big weather balloons are expensive.
I moved here in late 1998/early 1999 and a year or so later found out that I was working in the same building with Andy. We became friends and I tag along to watch the activities. Recently a new ham has moved in the area Thomas KT5TK A top notch electrical engineer from Germany, he was really interested in flying payloads on balloons and they guys really got active. Thomas and Andy are the leaders of the South Texas Balloon Launch Team. They started launching ALL THE TIME! I have a busy job and can't always be involved, but these guys do so many I can't keep up.
Regardless they keep the August flight as the "big" event and often send up two of more separate balloons when the fly. Many folks come out and it's a big event. Afterwards we go to "Hintzes" Bar-B-Que along HWY59 and talk about it over lunch until the recovery crew returns with the Balloon.
The Recovery crew is from a big Stereo shop in the River Oaks area (Where the Bushes live) They are all hams and love to transmitter hunt and chase that thing no matter how many miles it is away. They have never failed to recover it either. They are good.
Over all it's a day long event that we all have a good time with. Of late I am working with my telescope (125mm x 2000mm fl about and f15) trying to track it from the launch site, easier said than done. Clouds are a constant issue and despite the computerized controls on my telescope it's tricky. I use a standard NTSC camera or a USB camera for the recording which goes into a laptop. I have taken some really good still shots of the balloon at as high as 85000 ft. I'll keep trying and keep refining my methods.
Once you have seen what those guys do you will be impressed. Heck you might want to come back again, never know.
See if you can roust Gerald out and get him to come down here as well I know we could get him excited about it if he did get to come out. The offer stands Lunch is on me when you get to come down.
See you are Belton next weekend.

Joe

I was thinking you should come to the next big balloon launch in August 2014. Its been a long time since we have spoken at length but if you want to come down I'll make sure you get a great Bar-B-Que lunch that day my treat, same goes for Gerald if you bring or convince that hombre to come down for the day. I think you would enjoy the activities.

Subject: NWS Update on Severe Weather Potential today and Friday

Good morning,

A two-day period of unsettled weather is expected today and Friday. The overall severe weather threat this afternoon and evening and again on Friday afternoon and evening is limited. Most areas across north and central Texas will not experience thunderstorms, but any storms that do develop will have the potential to be severe with large hail and damaging winds.

The attached presentation gives additional details on the location of the areas that may be affected. In general, the greatest threat of severe thunderstorms both days will be in eastern areas of north and central Texas.

BOTTOM LINE: Emergency Managers, elected officials, and other public safety personnel in north and central Texas should be prepared for the potential of isolated severe thunderstorms this afternoon and evening and again on Friday afternoon and evening. The main area of concern this afternoon and evening will be east of Interstate 35, and large hail and damaging winds will be the primary threats. Decision makers west of I-35 also need to be prepared for elevated fire weather conditions this afternoon. Monitor our web page or other sources of weather information for updates through Friday.

LOCATIONS AND TIMING: For this afternoon and evening, the severe weather threat is along and east of a line from Sherman-Dallas-Waco-Killeen. For Friday afternoon and evening, the threat areas is generally along and east of a line from Paris-Corsicana-Waco-Temple. The most likely time frame for strong to severe thunderstorms will be 2 pm through 10 pm both days.

IMPACTS: Hail up to 1.5 inches in diameter and damaging thunderstorm wind gusts over 60 mph will be the primary impacts.

FORECAST CONFIDENCE: For today, low to moderate confidence exists in the development of thunderstorms. If storms DO form this afternoon, there is moderate confidence that some of them will be severe. There is overall low confidence on the severe weather potential on Friday.

ALTERNATE SCENARIOS: There are two primary alternate scenarios in the forecast for this afternoon. The first is that conditions will remain unfavorable for thunderstorm development and few or no storms develop across north or central Texas. The second scenario is that the dryline stalls west of our current forecast location and one or two severe thunderstorms develop west of Interstate 35. On Friday, the location of the cold front and the timing of thunderstorm development create a situation with numerous alternate scenarios.

To: undisclosed-recipients:
Subject: 1255 PM Weather Update....Isolated Severe storms are possible across the northern and eastern sections of South Central Texas...Low Chances.

South Central Texas Partners...

...HEADLINE...Slight Risk of Severe Weather late this afternoon and evening...for northern and eastern areas of South Central Texas.

...AREA OF CONCERN...Northern and eastern sections of South Central Texas. This includes areas mainly east of a Jarrell...to Seguin...to Cuero line and includes the counties of Williamson, Travis, Hays, Caldwell, Lee, Bastrop, Guadalupe, Gonzales, DeWitt, Lavaca, and Fayette. This is the area that the Storm Prediction Center has issued a "Slight" Risk of severe weather. This area includes the northern sections of I-35 corridor...and eastern areas of the I-10 corridor.

...IMPACTS...Isolated severe thunderstorms with large damaging hail, in excess of 1 inch in diameter. Damaging winds in excess of 58 mph are also possible but is less of a threat.

...TIMING...3 PM through 9 PM. As with most severe weather...the late afternoon and evening hours will see the highest risk. I-35 threat would be early in the period...with the I-10 threat over the southeast areas later toward evening. The overall threat will spread east through the day and end across the west as winds shift to the west. There will be some lingering storm threats over the SE counties (DeWitt, Lavaca) during the late evening

hours beyond 9 pm.

...CONFIDENCE...Low. Like the event last week...a dryline will be the primary trigger as it pushes into our area later this afternoon. Confidence is high that areas well to our northeast near the ARKLATEX will have plenty of severe weather later today. South Central Texas will be on the far western and southern edge of all this activity. For that reason overall confidence is low.

...DISCUSSION...a similar situation to last week...an upper level storm system and a surface dry line approaching from the west will help trigger thunderstorms across portions of Texas. Storms are expected to increase later this afternoon as a dry line pushes into a very moist and unstable airmass across central and east Texas. Warm air aloft is creating a "cap" or "lid" on the atmosphere here in South Central Texas which will keep most areas from getting any storm activity. However, where this cap is broken, maybe over the far north and eastern sections later today, any storm that does form may quickly become severe. For that reason the Storm Prediction Center has placed the northern and eastern areas of South Central Texas under a Slight risk of severe storms later this afternoon and evening. Overall the chances of seeing this activity is very low...but if it occurs, damaging severe hail may occur under the strongest storms.

Subject: NWS update: Sunday Severe Weather potential

Good afternoon,

We wanted to send an initial forecast message on the potential for severe thunderstorms Sunday afternoon and Sunday night. The weather pattern on Sunday, featuring a dryline, cold front, and an unstable airmass, will be favorable for an episode of strong to severe thunderstorms.

The weather on Friday, Saturday, and Saturday night looks relatively quiet with little or no chance of rain. Gusty south winds may cause problems minor problems at outdoor festivals today, Friday, and Saturday, but no thunderstorm activity is expected through Saturday night.

The primary threat area on Sunday afternoon and Sunday evening will be in areas along and east of Interstate 35/35W, or east of a line from Gainesville to Fort Worth to Killeen. Large hail, damaging wind, and a few tornadoes will be possible. The primary time frame for severe thunderstorms will be from 3 pm to midnight on Sunday.

A strong cold front will move through all of north and central Texas Sunday night, with dry weather and cooler temperatures forecast on Monday.

Since this potential event is 3 days out, the timing, threat areas, and impacts may change.

We will send an updated email message on Friday afternoon.

Cell Phone:(254) 721-0829

From: Tom Bradshaw - NOAA Federal [mailto:tom.bradshaw@...]
Sent: Friday, April 11, 2014 12:49 PM
To: undisclosed-recipients:
Subject: NWS severe weather update concerning Sunday storm system

Good afternoon,

We're still facing the threat of severe weather across North and Central Texas on Sunday...particularly in the afternoon and evening hours. We'll have the classic severe thunderstorm ingredients coming together during that time period, including a dryline to our west, a cold front approaching from the north, an unstable airmass, and an upper level disturbance exiting the Rockies. Adequate wind shear aloft will also be present. A graphic is attached, outlining the basic schematic of this upcoming event.

BOTTOM LINE

Scattered thunderstorms are expected to develop across North and Central Texas Sunday. Some of these thunderstorms may become severe, producing large hail, damaging winds, and one or two tornadoes. Emergency managers, elected officials, and other public safety personnel should remain alert for the potential of severe thunderstorms, and consult updated information from the National Weather Service as the weekend progresses.

LOCATION AND TIMING OF THREATS:

The primary threat area on Sunday afternoon and Sunday evening will be in areas along and east of a line from Bowie to Stephenville to Lampasas. Some showers and thunderstorms may be ongoing across the area prior to Noon

Sunday. However, stronger storms may begin to form by early afternoon closer to the dryline, in areas west of Interstate 35. The primary time frame for severe thunderstorms will be from 3 pm to 10 pm Sunday afternoon and evening.

The threat of severe weather, including one or two tornadoes, will exist across all of north and central Texas during this period. However, the likelihood of severe thunderstorms will be greatest north of Interstate 20 during the late afternoon hours.

A strong cold front will move through all of north and central Texas late Sunday night, with dry weather and cooler temperatures forecast on Monday.

FORECAST CONFIDENCE:

As of now, we think there is a good chance that severe weather will occur in at least a few areas of North Texas on Sunday...with large hail the most likely threat. However (as of now!), we don't believe the forecast setup favors a widespread, significant severe weather episode. Overall confidence in the development of thunderstorms is high. The confidence that severe thunderstorms will develop is moderate. The threat of tornadoes is low.

The potential limiting factor Sunday could be the presence of substantial cloud cover (and antecedent showers), which would limit the amount of instability in place across the area during the afternoon. If clouds do form, it may be difficult for developing thunderstorms to become severe.

To: undisclosed-recipients:
Subject: Sunday severe weather chances.

South Central Texas Partners...

...HEADLINE...Slight Risk of Severe Thunderstorms Sunday afternoon and evening...for northern areas of South Central Texas.

...AREA OF CONCERN...Northern sections of South Central Texas....including areas along and north of Highway 290...or from Fredericksburg...through Austin...to Giddings. This is the area where the Storm Prediction Center has drawn an area for a "Slight" risk of severe storms. This area includes the counties of Gillespie, Blanco, Llano, Burnet, Williamson, Travis, Hays, Lee, Bastrop, and Fayette.

...IMPACTS...Isolated severe thunderstorms with large damaging hail, in excess of 1 inch in diameter. Damaging winds in excess of 58 mph are also possible.

...TIMING...Noon through 9 PM for the overall storm chances. The best time for severe storms will come slightly later in the afternoon...after 3 pm.

...CONFIDENCE...Low. The bulk of the upper level energy will be north of South Central Texas. So like usual, the best severe chances will stretch from Central Texas up through Oklahoma. Daytime heating and an approaching dry line will be the main triggers so we run the risk of getting storms across our northern areas...or they build down as far south as Temple and we get nothing. These are just a couple of options out there. Overall rain chances remain low.

...DISCUSSION...A typical spring scenario is shaping up for Sunday...a storm system is approaching from the SW U.S and will track mainly north of our area across the Southern Plains. A trailing dryline will create only modest lift across the western Hill Country. Some weak energy aloft may actually trigger some morning shower activity Sunday although this is not expected to be widespread. As the day heats up, isolated thunderstorms may begin to form over the Edwards Plateau and then move into or develop in the South Central Texas area. This is again a low chance severe event and any severe storms that do develop should be fairly isolated. The afternoon and evening hours hold the best chances for seeing the storms develop...mainly after 3 pm. Areas along and north of Highway 290 from Fredericksburg to Giddings is the area where we will be watching closely. The severe storm threat will lower considerably after 9 pm, once the sun sets and energy moves northeast of the area.

The chance of mainly non-severe showers and thunderstorms will continue into Monday with an approaching cold front. So even if areas dont see activity Sunday afternoon and evening, there could be some storm development the first part of Monday as the cold front pushes through South Central Texas.

Subject: NWS update: Severe Weather potential through Monday night

Good afternoon,

There will be two chances for strong to severe thunderstorms across north and central Texas through Monday night. The first chance will be late this afternoon and this evening across a small part of our western area. The second and more substantial threat will be Monday afternoon into Monday night across a large part of north and central Texas.

A short slide presentation is attached that depicts the timing, impacts, and threat areas for strong to severe thunderstorms through Monday night.

For this afternoon and this evening, the best focus for strong to severe storms will remain in west Texas along the dryline. Even though we have fairly high chances for showers and thunderstorms in the forecast through tonight, most of these storms are expected to remain below severe levels and pose mainly a lightning threat. One or two storms could move off of the dryline late this afternoon and bring a marginal severe weather threat as far east as Bowie, Mineral Wells, and Eastland before the storms diminish by 10 pm this evening.

A cold front will move south from Oklahoma into north Texas on Monday afternoon. With very unstable air in place, scattered to numerous thunderstorms are forecast to develop near the front. A few of these storms will likely be severe, with a threat of hail up to golf ball size, damaging winds over 60 mph, and isolated tornadoes. The greatest threat area on Monday is highlighted on the attached graphic, and includes most of north and central Texas. The timing for the most intense storms on Monday will

generally be from 3 pm to 9 pm in the north, and 5 pm to 11 pm in the south.

Date: 2014-04-25 21:56:04 UTC
From: Joe Dorn, W5VEX
Topic: 5644 Message: 5644

Here is the Austin/San Antonio (EWX) take on the weekend events. I tend to like this projection better than the one from up north.

Joe B. Dorn, W5VEX

To: undisclosed-recipients:
Subject: Severe Weather Potential Across South Central Texas...Saturday and Sunday

South Central Texas Partners...

...HEADLINES...There is a Slight Risk of severe storms Saturday and again on Sunday for portions of South Central Texas.

...AREA OF CONCERN...Saturday...Hill Country and Edwards Plateau generally west of a Burnet to Eagle Pass line. Sunday...threat shifts east generally east of a line from Jarrell to Hallettsville.

...IMPACTS...Large hail greater than 1 inch in diameter and damaging winds in excess of 58 mph. Isolated tornado threat. Fire threat on Sunday for the western half of the South Central Texas.

...TIMING...3 pm to 9 pm each day.

...CONFIDENCE...Moderate. The date on the calendar tells us that this time of year, if you have all the ingredients in place, storms will have little problem reaching the "severe" criteria. This event will once again be focused to the north of South Central Texas...but any storm that does form over our area...will have a good chance of becoming severe.

...DISCUSSION...Another weekend severe weather threat...and as with the others this year...the chances of overall rain will remain small...and areal coverage will be limited. An upper level disturbance will affect the OK/N TX area on Saturday. This may be just close enough to trigger isolated to scattered severe late afternoon/evening storms to our west across the

Edwards Plateau, Hill Country, and northern Mexico. If these storms do form on Saturday...they will move east and possibly affect our western most areas of South Central Texas between 3 and 9 pm. The area west of a Burnet to Eagle Pass line will see the best chances. It appears right now that the threat on Saturday will remain west of the I-35 corridor (Austin and San Antonio)...but will continue to monitor.

On Sunday...the upper level storm system will still be to our north across the OK area...while a dryline (Boundary with very low humidities behind it) will push east across our area. This dryline will dry the atmosphere to the west, but may provide lift to help trigger strong to severe storms Sunday afternoon and evening mainly east of a Jarrell to Hallettsville line. The threat will be mainly east of the I-35 corridor. Since rain remains scarce...the westerly winds and low humidities on Sunday afternoon across the Hill Country and Rio Grande Plains will bring a higher fire danger. This fire threat will remain higher than normal through the first part of next week.

You can see the latest forecasts and watches/warnings/advisories by going to the Austin-San Antonio National Weather Service website at <http://www.weather.gov/austin> www.weather.gov/austin

Just a glitch.

I have this old Mac computer at home. The version of Office for Mac is too old to let me save direct to a PDF.
So I email it to myself at work and use that Office for Windows to save it as a PDF.

The problem is used some fonts on the Mac that aren't on the Windows PC. So having to substitute probably caused it to drop too low and get cut off.

Sorry.

Myron

Some possible good news from our NWS folks to the south (ewx).

Joe B. Dorn, W5VEX

7969 West FM 93

Belton, Texas 76513

Home Phone: (254) 939-5918

Cell Phone:(254) 721-0829

From: Paul Yura [mailto:paul.yura@...]
Sent: Wednesday, May 07, 2014 10:47 AM
To: undisclosed-recipients:
Subject: Severe weather possible later today into Thursday...isolated heavy rain potential is increasing.

South Central Texas Partners...

...HEADLINE...Severe Storms are possible across western portions of the area tonight...Most of South Central Texas on Thursday. Increasing threat for isolated heavy rain amounts.

...AREA OF CONCERN...Wed Afternoon and Evening...areas along and just east of the Rio Grande including Val Verde, Edwards, Kinney, and Maverick Counties. Overnight into Thursday...most of South Central Texas including the Austin-San Antonio metro areas.

...IMPACTS...Severe thunderstorms with large hail and damaging winds being the main threats. Isolated heavy rain threat, which could lead to isolated flash flooding/flooding concerns.

...TIMING...Severe threat is highest during the late afternoon and evening today...and again on Thursday. Overnight tonight the storm threat will continue...with a slight decrease in severe chances, but slight increase in isolated heavy rain threat.

...CONFIDENCE...MODERATE in both the threat for severe weather and isolated heavy rain threat. Have LOW confidence about timing and how the whole pattern will evolve.

...DISCUSSION...A spring pattern is developing where we have a large upper level storm system over the SW U.S. and it will be pushing our direction

over the next 36 hours. High humidity across the region will provide the fuel needed to help feed storms that are forecast to develop because of this system. Storms will likely form over the mountains of northern Mexico and West Texas later today and by late afternoon and evening, some of those may affect the far western areas out by Del Rio, Eagle Pass, Rocksprings, etc. Some of these storms may be severe with large hail and damaging winds. Some models are then keeping this activity overnight, pushing into the central area of South Central Texas overnight into early Thursday. Other models are decreasing the activity overnight...and then forming more activity on Thursday across the central and eastern sections of South Central Texas. There are several ways this scenario could play out over the next 36 hours as the upper level low will likely send several small disturbances our way. We are not expected to see storms and rain for 36 straight hours, instead we a wave of activity, followed by a lull, and then likely another wave developing. Its May and its severe weather season. Everybody needs to be prepared to possibly see and deal with severe weather the next 36 hours regardless of where they live across South Central Texas. Unfortunately we cannot narrow down the timeline as of right now.

Of particular interest is the increasing chances of isolated heavier rain amounts. The cause of this increase is tropical moisture that is moving north from the Pacific...associated with an area of disturbed weather south of Mexico. Very rich tropical moisture, way above normal for this time of year, is spreading into Texas and if storms are able to tap into this moisture overnight into Thursday...we could have some isolated rain totals of several inches...maybe even some isolated Flash Flooding. Its hard to imagine flooding when we have been so dry this Spring...but don't let your guard down when it comes to heavy rain potential in South Central Texas.

Keep a good weather watch the next couple of days and keep good situational awareness by watching radar and have multiple ways of receiving weather watches and warnings. Stay vigilant.

7969 West FM 93

Belton, Texas 76513

Home Phone: (254) 939-5918

Cell Phone:(254) 721-0829

From: Greg Patrick [mailto:gregory.patrick@...]
Sent: Wednesday, May 07, 2014 1:53 PM
To: undisclosed-recipients:
Subject: NWS UPDATE: Severe Weather Potential through Thursday

Good afternoon,

Isolated thunderstorms are in the forecast for most of north and central Texas through this afternoon. However, the potential for severe thunderstorms late this afternoon and this evening is confined to a small western portion of the area. There is a somewhat greater potential for severe weather beginning late tonight and into the day Thursday. A short pdf has been included to depict timing, impacts and areas likely to be affected through Thursday.

BOTTOM LINE: Areas to the west of a line from Jacksboro to Granbury to Goldthwaite should be prepared for the possibility of isolated severe thunderstorms from 5 pm to 9 pm today. Emergency Managers, public safety and elected officials, and storm spotters should be prepared for thunderstorms and a severe weather potential late tonight through Thursday.

IMPACTS: The primary threats for this afternoon and evening are damaging winds and large hail. The primary threats for late tonight into Thursday evening will be large hail, damaging winds, and a low potential for flash flooding. The potential for tornadoes across north and central Texas on Thursday afternoon is very low, but not zero.

AREA OF GREATEST CONCERN: This afternoon and evening: western sections of north Texas including Graham, Mineral Wells, Stephenville and Comanche. For late tonight into Thursday: all areas of north and central Texas. The severe weather potential will gradually diminish from west to east during the afternoon and evening hours on Thursday.

TIMING: The severe weather threat in the western areas this afternoon and evening will be from 5 PM to 9 PM. For tonight into Thursday, strong to severe thunderstorms will begin spreading into western sections of north Texas after midnight tonight, and will gradually spread into eastern sections of the area during the rest of the morning and afternoon hours on Thursday.

FORECAST CONFIDENCE: There is low confidence in the forecast for this afternoon and evening and overall moderate confidence in the forecast for late tonight into Thursday.

ALTERNATE SCENARIOS: All of these scenarios are possible late tonight into Thursday, in general order of likelihood:

* Thunderstorms become widespread, but not severe, Thursday morning and a few severe storms develop east of I-35 on Thursday afternoon and evening.

* Rain and thunderstorms become widespread late tonight and Thursday, and keep the atmosphere too stable for severe thunderstorm development in any area of north Texas through Thursday evening.

* Rain and thunderstorm activity late tonight and Thursday morning is very limited, and sunshine allows the atmosphere to become extremely unstable in some areas by Thursday afternoon. Scattered severe thunderstorms, with very large hail and a tornado threat, develop across some part of north or central Texas on Thursday afternoon.

Sent: Thursday, May 08, 2014 10:35 AM
To: undisclosed-recipients:
Subject: Weather Update 1030 am Thursday...Severe Weather threat continues this afternoon and evening

South Central Texas Partners...

...HEADLINE...There is a slight risk of Severe Storms across most areas of South Central Texas this afternoon into the evening. Isolated heavy rain amounts possible mainly east of Interstate 35.

...AREA OF CONCERN...most of South Central Texas including the Austin-San Antonio metro areas.

...IMPACTS...Severe thunderstorms with large hail and damaging winds being the main threats. Isolated heavy rain threat, which could lead to isolated and brief flash flooding/flooding concerns mainly east of Interstate 35.

...TIMING...Thursday...2pm-10pm. Friday...2pm-8pm.

...CONFIDENCE...Low in both the threat for severe weather and isolated heavy rain threat.

...DISCUSSION...We got through the night without much trouble as most of the significant activity stayed across northern and western portions of Texas. This morning we are seeing scattered shower and thunderstorm activity mainly east of Interstate 35 and this will continue much of the day. The main concern will be the clearing skies over the western half of Texas where heating of the day and weak energy aloft will allow for scattered storms to form along the dryline this afternoon. There is a slight risk of severe

weather across most of the area later today as these storms could fire up by early afternoon and then move east into the Hill Country, I-35 Corridor, and then across the eastern half of the area by late evening. Overall chances of rain are higher in the east...lower out west. Large hail and damaging winds will be the primary threat. The chances of rain today will remain high over the east as very humid air from the Gulf and Pacific moves across the eastern sections of Texas. This very humid air will also allow for some isolated heavier rain totals which could bring some brief flooding issues. For the major metropolitan areas of Austin and San Antonio, I think the main concern today will be the chances of severe weather during afternoon/evening commute. We could see some rain totals that go above 2 inches, but most areas will see way less than that, especially out west.

By late tonight will we see most activity dissipate and/or move east...but will still carry a chance of rain/storms overnight. The atmosphere won't totally dry out for Friday, meaning that more heating Friday afternoon could trigger some isolate to widely scattered thunderstorms. Even a few of these could become strong/severe. This should be isolated though.

Its May and its severe weather season. Everybody needs to be prepared to possibly see and deal with severe weather the next 36 hours regardless of where they live and the overall chance for rain. Keep a good weather watch the next couple of days and keep good situational awareness by watching radar and have multiple ways of receiving weather watches and warnings. Stay vigilant.

Cell Phone:(254) 721-0829

From: Paul Yura - NOAA Federal [mailto:paul.yura@...]
Sent: Saturday, May 10, 2014 9:18 PM
To: undisclosed-recipients:
Subject: Severe weather potential on Monday, Heavy rain threat Monday into Tuesday

South Central Texas Partners...

...HEADLINE...Cold front expected late Monday or early Tuesday, severe storms and locally heavy rain possible into early next week...

...AREA OF CONCERN...Isolated severe weather threat on Monday and Monday night for all of South Central Texas. Heavy rain threat primarily along and east of Highway 281.

...IMPACTS...Severe storms with large hail and damaging winds. Widespread rains of 1-2 inches possible...isolated higher totals of 3-5 inches possible Monday through Tuesday.

...TIMING...Storm chances increasing Monday afternoon...peaking Monday night into Tuesday morning. Storm chances lingering through Tuesday night.

...CONFIDENCE...Moderate

...DISCUSSION...A late season cold front and strong upper level storm system will cross the area Monday and Tuesday. We are expecting storms, a few of which could be severe, to develop ahead of a cold front that is expected to push through the area late Monday night into early Tue morning of next week. Weather models have been consistent the past few days of developing widespread rains across South Central Texas. A couple of waves of thunderstorm activity could affect the area in the 36 hour period from Monday afternoon through Tue Night. Widespread rains of 1-2 inches would be

very welcome across the area. Isolated higher totals of 3-5 inches are possible...mainly along and east of Highway 281. The area remains very dry so widespread flooding is not expected, but just as we saw yesterday, isolated higher rain totals and rain rates can quickly lead to impassable roads, etc., and isolated flash flooding concerns.

Will continue to keep you updated through Monday on this upcoming weather system. Overall, be cautious on Monday and Tuesday, expect to see areas of thunderstorms, some of which could produce some severe weather and isolated flash flooding.

You can see the latest forecasts and watches/warnings/advisories by going to the Austin-San Antonio National Weather Service website at <http://www.weather.gov/austin> www.weather.gov/austin

Cell Phone:(254) 721-0829

From: Jon Zeitler [mailto:jon.zeitler@...]
Sent: Monday, May 12, 2014 5:28 AM
To: undisclosed-recipients:
Subject: 530 am Mon 5/12 -- Severe Storm and Heavy Rain/Flood Forecast from NWS

South Central Texas Partners...

...HEADLINE...Severe storms also possible late this afternoon and evening. Flash flood watch from 7 pm through noon Tuesday...

...AREA OF CONCERN...The entire area for severe storms late this afternoon and evening. Then locations along and east of U.S. Highway 83 for heavy rain late tonight into Tuesday morning.

...IMPACTS...The severe storms will have a main threat of damaging winds and a lesser threat of large hail. Rainfall late tonight into early Tuesday will average from 1 to 3 inches east of U.S. Highway 83, with isolated spots receiving up to 5 inches.

...TIMING...The severe threat mainly from 3 pm to 10 pm. The heavy rain threat mainly from 10 pm to 6 am, which could cause significant issues for the Tuesday morning commute.

...CONFIDENCE...High

...DISCUSSION...Moist Gulf air, an upper level trough, and a cold front will combine to produce widespread showers and thunderstorms across the area from

late this afternoon through noon Tuesday. Severe storms are possible ahead of the front late this afternoon through late evening. Heavy rain is possible along and behind the front late this evening through Tuesday morning. While massive flooding is not expected, the rainfall may occur in a 2-4 hour period, and cause significant flooding in urban areas and water rises in north-to-south flowing rivers and creeks such as the Frio, Sabinal, and Nueces. Please emphasize with your staff and the public to Turn Around, Don't Drown and not drive anywhere where deep water covers the road. As usual, the rain and flooding will be overnight, when visibility is greatly reduced. The morning commute could be difficult in Austin and treacherous in San Antonio if the forecast rainfall occurs, as low water crossings and low-lying spots may be flooded, and heavy rain still ongoing in San Antonio.

Subject: NWS UPDATE: Monday's Heavy Rain and Severe Weather Potential

Good afternoon,

An unseasonably strong cold front and potent upper level system will lead to a period of shower and thunderstorm activity across most of north and central Texas this afternoon into Tuesday. Although beneficial rains will fall in some areas plagued by drought, isolated severe thunderstorms and areas of excessive rain may cause problems through tonight.

The attached pdf graphics depict our latest thinking on the severe weather and heavy rainfall threats through tonight.

BOTTOM LINE: Emergency Managers, public safety and elected officials, storm spotters, and event organizers should be prepared for the threat of severe thunderstorms and excessive rainfall through tonight. Precipitation chances will gradually diminish from west to east on Tuesday and Tuesday night, with much cooler weather forecast in all areas by Wednesday.

IMPACTS: The primary threats through tonight will be excessive rainfall, large hail, and damaging winds up to 65 mph. A Flash Flood Watch has been issued for this afternoon and tonight in areas that received heavy rainfall last week and for areas that we think have the greatest potential for flash flooding. We expect rainfall amounts of 2 to 4 inches across the Flash Flood Watch area, which could cause major flooding problems especially in low lying areas and urban areas.

TIMING: Scattered thunderstorms, a few strong to severe, have already developed across the area early this afternoon. The overall coverage of the thunderstorm activity will increase through the afternoon and evening hours. The time frame for the most intense thunderstorms will be from 3 pm to 10 pm today; the time frame for the heaviest rainfall will be from 4 pm this afternoon until 5 am Tuesday morning.

FORECAST CONFIDENCE: There is moderate to high confidence in the forecast through tonight.

Jason.

You will be most welcome on our VE team. I have added you to my VE list and you are will be most welcome to attend any of our test sessions to see how it works.

When we need VE's, I send out a notice to my list and relate the request, time, and location.

Subject: Working to become an General Class VE.

Mr. Dorn,

I am not sure if you remember me, my name is Jason Bradshaw (KE7MXM). If you remember, I upgraded with you before I left for this deployment. When we spoke I informed you that I would try to participate on the Nets from here. Well, unfortunately the internet service out here is not reliable enough for Echolink. I seriously wish that I could be on the air as I am missing my hobby. I am also very interested in joining the clubs when I get back to America.

I wanted to tell you how much it meant to me for you guys to administer my test on such short notice, and that you even paid for it. Since then I have felt the need to help other hams out who are trying to get into the hobby. I have decided to become a VE.

I have already completed the application and will be getting it on digits tomorrow at work. I will then sign it and send it in via e-mail. I have finished the Open-Book review, and feel pretty confident with the material. I should have my accreditation soon if the good lord is willing.

I was wondering if you could use a General class VE for some of your tests?
I would really enjoy being a member of your VE team.

I hope to hear from you soon,

Jason

Subject: Memorial Day Weekend rain chances

South Central Texas Partners....

This will serve as a very brief heads up on this weekends weather.

While at this time we do not expect significant occurrences of severe weather or flooding rains in South Central Texas, we are going to carry fairly low chances of showers and thunderstorms through the weekend into early next week. Its May, and the atmosphere will support locally heavy rainfall. It is not out of the question that some spots could total several inches of rain over the next several days. West, NW, and North Texas will see the most amount of rain this holiday weekend.

Our best chances of seeing thunderstorm activity in our area will be along the Rio Grande. Just like we saw last night...clusters of storms may form over northern Mexico...and push across the Rio Grande by the evening and overnight hours.

I will be watching the situation over the weekend and will send out better detailed messages if conditions warrant. Until that happens, be cautious outdoors, if threatening weather approaches, seek shelter. There are a lot of outdoor activities and events that are planned....Lightning is a killer. Seek shelter if necessary.

Visit our webpage at www.weather.gov/Austin for the latest forecast information.

5662. TX Red Cross Radio Roundup

Yahoo group: Temple_ARC
Date: 2014-05-24 23:53:59 UTC
From: kevinmccoy@...
Topic: 5662 Message: 5662

This round up is sponsored by the CENTEX and Gulf Coast Red Cross Regions.

All Red Cross Radio Amateur Operators in Texas are invited to check into our special event – The Red Cross Radio Roundup. This event is open to Red Cross Amateur Radio Operators – and ARES Red Cross support teams and Club stations.

There are four nets you can participate in.

I) Echolink (and or IRLP VHF/UHF) net;
II) 2 HF Nets, and
III) a Digital Net.

Please check into as many of these nets as your license and capabilities allow.

Radio-less Hams – Please get signed up for Echolink at a minimum.

You can also use your chapter station. Or find a nearby Hospital station or radio club station that you can use. Many ARES organizations also have Go-kits that may benefit from some testing. So reach out and plug in. Email me if you need to know who the ARES EC is for your county, or try to find this out on the web.

Under our MOU with ARES both organizations promote joint membership. So Red Cross Operators should also consider joining your local ARES group to improve your operations skills.

Please keep copies of the TX State Red Cross ICS 217. Place one copy with each of your Home station, Mobile Station, portable go kits. Also place one in your radio room and chapter Disaster Plan.

These nets are directed nets. You cannot go wrong if you follow the instructions of Net Control.

Instructions for each net are below

I Echolink Net

In the event of an emergency we would link our counties together using an Echolink / IRLP bridge. This bridge is available on an as needed basis.

Echolink software is available at Introducing EchoLink http://www.echolink.org/

http://www.echolink.org/

Introducing EchoLink http://www.echolink.org/ Windows 7, 8, and Vista Information

View on www.echolink.org http://www.echolink.org/
Preview by Yahoo

Start Echolink.

Under Stations select find. Search for “echotest”. This will allow you to test your microphone and Audio settings.

Now search for “DCF-ARC”. This stands for Disaster Communications Forum – American Red Cross. This bridge is available in emergencies on an as needed basis without any formal permission.

Add DCF-ARC to your “favorite” stations. If you want to test there is a regular weekly nets held 8PM CDT on Sunday for Red Cross folks.

If you have a local IRLP repeater it can be bridged to the net. Please get permission from your local repeater trustee if you intend to do this. The node numbers are [IRLP 9257 EchoLink 336037]). If you need further instructions email kf5fuz@... mailto:kf5fuz@...

This net is scheduled for Wednesday June 11, 2013 at 18:30 CDT (23:30z).

We will be checking in by chapter.

When called on please give your Call sign and county. You can also briefly add your group function – For Example “Mass Care”, “DAT Team”, or “DST”

You will also be able to check in via the text box. Please put ** in front of your check in message.

We will call for check-ins by chapter and region - Each station would “check in” and identify by Call Sign, Name, principle Red Cross Group, and County.

If you are in an organization supporting Red Cross you can identify by giving Call Sign, Name, Organization, and County. For example
KG5LT, Dale, Brown County ARES, serving Red Cross.

This is a directed net. Please follow the directions of net control.

II HF nets –

Under agreement with South Texas ARES their June 9, 2014 Monday Night 19:30 CDT Net (3.873MHz) will be a special net.

On this net Red Cross volunteers and collocated stations can check in and state “Red Cross” as their affiliation. So give your call sign slowly and phonetically using ITU phonetics. Then say “Red Cross”.

For example I would say “This is” (pause to check for doubles) “Kilo Foxtrot Five Foxtrot Uniform Zulu – Red Cross” and then wait for Net Control to acknowledge my call.

This is a directed net, so please listen to the instructions from Net Control.

Please check in by your County!

This will be by section (North or West) if you are in North or West Texas Section.

If you are part of South Texas Section then you check in by district.

Districts and counties will be announced by Net Control. If you need a listing of districts and counties, then email me or see the South Texas ARES web site:
http://www.arrlstx.org/index.php/ares http://www.arrlstx.org/index.php/ares

NORTH TEXAS NET - -

All operators with sufficient privileges are asked to participate in the North Texas ARES Net. Operators in Counties in North Texas ARES section are asked to make a special effort to check into the North Texas ARES information net Wednesday June 11, at 20:30 CDT on 3860+/-. This is in addition to the STX net.

Please add Red Cross after your Call Sign.

III) Digital Check in

Red Cross Hams send email via VHF/UHF Packet and/or HF WINLINK/Pactor/or Robust Packet to W5KA@... mailto:W5KA@... , KD5WHD@... mailto:KD5WHD@..., and TXRCAUS-DST@... mailto:TXRCAUS-DST@... .

Please identify your Name, organization, and county.

Do this by Midnight CDT 06/11/14

Please indicate the station you are sending it by and the mode. HF, Packet, and Telnet based emails are appreciated.

Sample:

To: W5KA,KD5WHD,TXRCAUS-DST

5663. FW: NWS Update: Ongoing Potential for Heavy Rainfall and Severe Thunderstorms

Yahoo group: Temple_ARC
Date: 2014-05-25 23:07:16 UTC
From: Joe Dorn, W5VEX
Topic: 5663 Message: 5663

This update is from the Fort Worth NWS, FWD; another will follow from the Austin/ San Antonio NWS, EWX. Both are calling for a rain event over the next couple of days but are cautious on how much and when

I have been watching a big blob of moisture slowly move across west Texas for the last day or so and it is now dropping some rain in Lampasas and Coryell Counties. The system might work up enough courage to cross IH-35 but don't count the rain drops until they are in your CoCoRaHS rain gauge.

Subject: NWS Update: Ongoing Potential for Heavy Rainfall and Severe Thunderstorms

Good afternoon,

We hope everyone is enjoying a happy and safe Memorial Day weekend. This is a quick update on the significant weather situation facing North Texas through mid-week.

We have 3 factors that will continue to work together in the production of heavy rain and possible severe weather through Wednesday: 1) A slow moving upper level storm system over New Mexico (which will begin moving E tonight); 2) Abundant moisture and instability in place over North Texas; and 3) Multiple surface boundaries persisting across the region. These elements comprise a summer-like weather pattern, which unfortunately means that it's difficult to predict the occurrence, location and intensity of rainfall or severe weather episodes with much precision. The important takeaway here is that as the upper low moves eastward toward (and across) N Texas tonight through Wednesday, we'll have multiple rounds of:

1) Locally heavy rainfall with possible flash flooding, and

2) Isolated severe thunderstorms, with damaging wind gusts the primary threat.

BOTTOM LINE: From this afternoon through Wednesday, jurisdictions throughout North Texas need to continue to closely monitor the weather situation, and be prepared for a heightened potential of flash flooding, as well as thunderstorms with damaging winds and frequent lightning. While the period of greatest threat will extend from Monday afternoon through Tuesday night, storms with excessive rain, damaging winds and lightning are possible this afternoon and tonight as well. Elected officials, emergency managers, and other public safety personnel need to maintain situational awareness on this event throughout the next 3 days.

AMOUNTS AND IMPACTS: Much of North Texas should wind up seeing 1 to 3 inches of rainfall by the time this system moves out of the area Thursday. However, some city to county-sized areas could very well see total amounts of 3 to 6 inches. We've already seen storms demonstrate the ability to produce copious amounts of rainfall over our far western counties. If similar storms train over urbanized and poorly drained areas, we could easily see flash flooding occur.

AREA OF GREATEST CONCERN: Difficult to pinpoint exactly, but in general, areas west of I-35 will be favored today and Monday, while all areas of North Texas are likely to be affected Tuesday into Wednesday.

TIMING: Peak period of concern will be Monday afternoon through Tuesday night. Each day, the threat (for both heavy rain and severe wind gusts) will be greatest in the afternoon and evening hours. However, jurisdictions need to be prepared for excessive rainfall occurring overnight as well.

FORECAST CONFIDENCE: There is moderate to high confidence that we will see a widespread rainfall event, and that localized areas will experience excessive rainfall or isolated severe weather. However, there is low confidence in the ability to pinpoint the location and timing of individual flooding or severe weather events.

ALTERNATE SCENARIOS: At this time, the pattern doesn't appear conducive for an extreme rainfall/flash flooding episode. However, if moisture were to further increase over the area, and thunderstorms were able to focus and train along an unforeseen surface boundary, then we could encounter higher localized rainfall than we're currently expecting. Right now, this is only an outside threat, but one that jurisdictions need to keep their eyes open for.

To: undisclosed-recipients:
Subject: Sunday Weather Update...Locally heavy rainfall, severe storms are possible thru mid week.

South Central Texas Partners...

...HEADLINE...Areas of thunderstorms, some producing heavy rain and severe weather, are possible Today, Memorial Day, and into mid week

...AREA OF CONCERN...Sunday and Monday, the threat area will likely remain along and west of I-35. Tuesday and Wednesday, the threat will spread to areas mainly along and east of I-35

...IMPACTS...There will be a severe threat (large hail and damaging winds) today and Memorial day mainly along and west of a Fredericksburg to Carrizo Springs line. This includes much of the Hill Country, Edwards Plateau, and Rio Grande area. There is a smaller chance that severe storms will affect the I-35 corridor over the next couple of days. Heavy rain threat, with localized flash flooding possible, will affect the Hill Country, Edwards Plateau, and Rio Grande. Several rounds of storms over the next several days can produce isolated 1-3 inches of rain each round. So over the next several days, we could see isolated rain totals over 5+ inches in a few locations. Something to watch.

...TIMING...Late afternoon into the overnight hours are the favored times to see activity. If a large cluster of storms moves in overnight, lingering activity through the morning hours is also possible.

...CONFIDENCE...Moderate.

...DISCUSSION...a large broad upper low pressure area is spinning over northern New Mexico. These big Lows will send out smaller waves (triggers) that form thunderstorms. This has been happening the past few days over West Texas where they have been dealing with severe weather and heavy rainfall. This upper low will slowly move east into the Texas Panhandle the next couple of days, shifting the action to the east as well and likely impacting our South Central Texas area over the next several days. Timing for when and where storms will form over the next several days will be tough, but typically in these scenarios storms will form in the afternoon hours, become a large cluster of storms overnight, moving east. So through Memorial Day we are looking for this same scenario...storms forming mainly over West Texas, moving into the western portions of South Central Texas during the late afternoon through overnight hours. That is not to say we cant have storms develop right on top of us, we can. Large Hail and damaging winds are primary threats through midnight each night...then it transitions to more a locally heavy rain threat where 1-3 inches of rain may fall with slow moving storms. These storms will typically lay out outflow boundaries which could help trigger additional storms that day or even the next day.

Locating where the heaviest rainfall will occur over the next several days is nearly impossible in this type of pattern. We will have to see how it evolves through Monday, see the areas that get hit most often, and then concentrate on those areas for larger flash flood potential later in the week. The area remains very dry and we can take some rain. As typical here, some roads may flood with only a few inches of rain...expect to see this over the next several days. This sort of pattern is promising to get some much needed rain...especially over West, West Central (San Angelo), and North Texas. How much we will get is still in question.

With the activities of the Memorial Day Weekend...keep the cell phone close by, have a way to watch radar and be cautious of lightning. Heavy rain during the overnight hours is possible the next several nights primarily west of I-35, so be careful and keep a high situational awareness.

The next planned update will be issued Monday morning.

5665. FW: "God Bless America"

Yahoo group: Temple_ARC
Date: 2014-05-25 23:36:49 UTC
From: Joe Dorn, W5VEX
Topic: 5665 Message: 5665

Once again I have received something from one of my ham buddies that I feel worthy of passing on to the world.

I was one of the kids that gathered about the old radios, vacuum tubes and outside wire antennas made the low fidelity, static loving AM radios work but it was the first mass media entertainment. I well remember Kate Smith and her delivery of "God Bless America", probably not the first one but she sang it quite often over the years even into early television.

Enjoy on this Memorial week end, see America as it was when we were the best and not ashamed of it.

The URL is after the text.

Joe B. Dorn, W5VEX

7969 West FM 93

Belton, Texas 76513

Home Phone: (254) 939-5918

Cell Phone:(254) 721-0829

A GOOD REMINDER TO BE THANKFUL FOR AMERICA !!!!!!!

Frank Sinatra considered Kate Smith the best singer of her time, and said that when he and a million other guys first heard her sing "God Bless America" on the radio, they all pretended to have dust in their eyes as they wiped away a tear or two.

Here are the facts... The link at the bottom will take you to a video showing the very first public singing of "GOD BLESS AMERICA". But before you watch it, you should also know the story behind the first public showing of the song.

The time was 1940. America was still in a terrible economic depression. Hitler was taking over Europe and Americans were afraid we'd have to go to war. It was a time of hardship and worry for most Americans.

This was the era just before TV, when radio shows were HUGE, and American families sat around their radios in the evenings, listening to their favorite entertainers, and no entertainer of that era was bigger than Kate Smith.

Kate was also patriotic. It hurt her to see Americans so depressed and afraid of what the next day would bring . She had hope for America , and

faith in her fellow Americans. She wanted to do something to cheer them up, so she went to the famous American song-writer, Irving Berlin (who also wrote "White Christmas") and asked him to write a song

that would make Americans feel good again about their country. When she described what she was looking for, he said he had just the song for her.

He went to his files and found a song that he had written, but never published, 22 years before - way back in 1917. He gave it to her and she worked on it with her studio orchestra. She and Irving Berlin were not sure how the song would be received by the public, but both agreed they would not take any profits from God Bless America . Any profits would go to the Boy Scouts of America. Over the years, the Boy Scouts have received millions of dollars in royalties from this song.

This video starts out with Kate Smith coming into the radio studio with the orchestra and an audience. She introduces the new song for the very first time, and starts singing. After the first couple verses, with her voice in the background still singing, scenes are shown from the 1940 movie, "You're In The Army Now." At the 4:20 mark of the video you see a young actor in the movie, sitting in an office, reading a paper; it's Ronald Reagan.

To this day, God Bless America stirs our patriotic feelings and pride in our country. Back in 1940, when Kate Smith went looking for a song to raise the spirits of her fellow Americans, I doubt whether she realized just how successful the results would be for her fellow Americans during those years of hardship and worry..... and for many generations of

Americans to follow.

Now that you know the story of the song, I hope you'll enjoy it and treasure it even more.

Many people don't know there's a lead in to the song since it usually starts with "God Bless America ....." So here's the entire song as originally sung..... ENJOY

Let us pray he still does, and it's still not to late.

Sent: Monday, May 26, 2014 10:03 AM
To: undisclosed-recipients:
Subject: Monday Weather Update...Threat for Heavy Rain and Severe Storms Continues

South Central Texas Partners...

...HEADLINE...Areas of thunderstorms, some producing heavy rain and severe weather, are possible again today (Memorial Day) and Tuesday.

...AREA OF CONCERN...Monday, the threat area will likely remain over the Hill Country, Rio Grande Plains, and the I-35 corridor. Tuesday...Hill Country and points east. Wednesday, the threat will spread to areas mainly along and east of I-35

...IMPACTS...Heavy rain threat is our biggest concern right now, with localized flash flooding possible, that will affect the Hill Country, Edwards Plateau, and Rio Grande areas. Several more rounds of storms over the next several days can produce isolated quick 1-3 inches totals in a 2 hour time frame.

Severe threat (large hail and damaging winds) today-Memorial Day across mainly the western half of South Central Texas, west of a Burnet to San Antonio to Laredo line. The severe threat will shift a bit east on Tuesday.

...TIMING...A cluster of storms will move through this morning and early afternoon bringing a heavy rain threat and an isolated severe threat. Late this afternoon and evening a severe thunderstorm threat will exist, then transition to heavy rain threat overnight once again. Will repeat this on Tuesday and again on Wednesday.

...CONFIDENCE...Moderate to High.

...DISCUSSION...A large broad upper low pressure area is spinning over northeast New Mexico. This big Low Pressure area will continue to send out small waves (triggers) that form thunderstorms. One batch of storms is moving through South Central Texas now. Localized heavy rainfall is possible. Some areas across Medina, Uvalde, and Bandera County received 4-6 inches of rain overnight with localized flooding along creeks and rivers. This upper low will slowly move east into the Texas Panhandle today, continuing to send waves of thunderstorm activity impacting our South Central Texas area over the next several days. Previous rainfall has left a cool air boundary in the area, which will help trigger additional storms later today into tonight. Timing for when and where storms will form over the next several days will be tough, but typically in these scenarios storms will form into a large cluster overnight, moving east through the night into the morning hours. So through Wednesday we are looking for this same scenario...storms forming mainly over West Central Texas, moving into the western portions of South Central Texas during the late afternoon through overnight hours. That is not to say we cant have storms develop right on top of us, we can. Large Hail and damaging winds are primary threats through midnight each night...then it transitions to more a locally heavy rain threat overnight and in the mornings where 1-3 inches of rain may fall with slow moving storms.

Locating where the heaviest rainfall will occur over the next several days is nearly impossible in this type of pattern. One area that is already setting up is the Uvalde, Real, Bandera, Medina County area. We will have to see how it evolves through Wednesday, see the areas that get hit most often, and then concentrate on those areas for larger flash flood potential. Additional Flash Flood Watches and Severe Weather Watches may be issued over the next couple of days. As typical here, some roads may flood with only a few inches of rain...expect to see this over the next several days. This sort of pattern is promising to get some much needed rain...especially over western and northern portions of South Central Texas.

How much we will get is still in question.

With the activities of the Memorial Day Weekend...keep the cell phone close by, have a way to watch radar and be cautious of lightning. Heavy rain during the overnight hours is possible the next several nights so be careful and keep a high situational awareness.

The next planned update will be issued Tuesday morning.

5667. RE: Rain Gauge

Yahoo group: Temple_ARC
Date: 2014-05-27 03:46:22 UTC
From: Joe Dorn, W5VEX
Topic: 5667 Message: 5667

Copied to other folks that might have an interest or heard me talking about it on the repeater today.

Bob.

I just joined CoCoRaHS that is a "citizen scientist" program where many folks contribute their rain gauge readings each day. To participate in the program, you must have one of the CoCoRaHS rain gauges that measures with great accuracy if properly mounted.

For more information on the program, go to:

http://www.cocorahs.org/

You can find the "How to's" and how to register on that site.

They also point you to a couple of places you can buy the approved rain gauge. I purchased mine from Ambient Weather, which is a little cheaper than the other source. Both sources are just under $30.00.

I also added another Weather Radio to my collection and Ambient had the cheapest price on that by several dollars compared to several other vendors. I purchased another Midland WR300, my third.

You can buy the gauges without being part of the CoCoRaHS network but the time to participate is only minutes a day if you had rain and seconds if you didn't. The report is preformatted and I have it set to come up first thing in the morning.

Mark McGraw, KF5HUG, is the Bell County Coordinator and a member of CTARC.

I wish that I had started the program earlier so that I would have a well documented history of my little dry corner of Texas.

Sarah and I have just completed the education phase of the Texas Master Naturalist program, sponsored by Texas Parks and Wildlife and Texas Agrilife and now have an obligation to give back 40 hours of volunteer time. This counts toward that. We are also going to be doing water quality testing of the Nolan Creek and Lampasas River near Belton and these two programs compliment each other.

I highly recommend you join the program.

5668. FW: Tuesday 245 pm Weather Update...Threat for Heavy Rain and Severe Storms Continues ********** FROM EWX **********

Yahoo group: Temple_ARC
Date: 2014-05-27 22:04:31 UTC
From: Joe Dorn, W5VEX
Topic: 5668 Message: 5668
Attachments: 2 described; binary payloads are missing from this source WARC

As I write this the NWS FWD is communicating with the amateur radio spotters on our SKYWARN repeater and a severe storm is passing through Mills County headed southeast. Most of the southern portion of the FWD CWA (County Warning Area) is under a Severe Thunderstorm Watch until 11:00 PM. The written report that follows is from Austin/San Antonio. (Highlighting in the message is mine)

The goodness of the recent and current storms is that they continue to drop their moisture in the Colorado and Brazos drainage areas upstream of the Dams. The current 5 day forecast for our area has the chance of rain for each day. A far cry from last year.

Joe B. Dorn, W5VEX

To: undisclosed-recipients:
Subject: Tuesday 245 pm Weather Update...Threat for Heavy Rain and Severe Storms Continues

South Central Texas Partners...

...HEADLINE...Periods of showers and thunderstorms will continue from this afternoon through Wednesday morning.

...AREA OF CONCERN...Severe storms possible west of U.S. 281, but the best chances for severe storms and minor flooding are east of U.2. 281 tonight through noon Wednesday.

...IMPACTS...Severe storms may produce large hail and damaging winds. There is only a very small chance for weak tornadoes. The much better chance is for rainfall of 1-3 inches in spots, which will produce minor flooding (underpasses, typical low-lying spots). A number of creeks and rivers are running near bankfull, so additional rain may cause them to go into minor flood stage.

...TIMING...Scattered showers and thunderstorms will continue across the eastern half of the area this afternoon. Some storms may move off the Mexican mountains and affect the Rio Grande Plains late this evening. An organized cluster of storms is forecast to develop near Waco after midnight and move south-southeast. This cluster may move across locations along and north of Texas Highway 71 between 4 and 8 am Wednesday morning.

...CONFIDENCE...Moderate.

...DISCUSSION...A large upper low continues to move slowly eastward along the Red River. Moist Gulf air and instability will combine with the low to maintain scattered showers and thunderstorms across the area through Wednesday. While the ingredients are close to minimal thresholds for severe storms, they are in place and would most likely produce damaging winds and large hail. A weak tornado is also possible. A weak east-west boundary will help to focus the storms over the northeastern quarter of our area -- generally along and north of Texas Highway 71, including Metro Austin. Individual storm cells may slide from west to east along the boundary as the overall cluster of storms moves south, resulting in training of cells over some locations, and the potential for 1 to 3 inches of rain. This amount of rain would fall within 1-2 hours, and thus may produce minor flash flooding. There will be a small chance of afternoon thunderstorms Wednesday afternoon through Saturday, but neither severe storms, nor heavy rain are expected.

You can see the latest forecasts and watches/warnings/advisories by going to the Austin-San Antonio National Weather Service website at <http://www.weather.gov/austin> www.weather.gov/austin

Once again the Temple Amateur Radio Club (TARC) board agreed that June is Pizza month. Bring your spouse or a friend who is interested in radio to the June 5th meeting and enjoy some pizza !

Also a reminder that the last weekend of June will be Field Day held again at the Texas Early Day Tractor and Engine Association grounds (TEDTEA). More information at the June club meeting.

See you there...

Sent: Wednesday, June 11, 2014 3:41 PM
To: undisclosed-recipients:
Subject: National Weather Service Update: Severe Weather Potential Tonight Through Thursday Night

Good afternoon,

After a quiet day today, there will be multiple opportunities for strong to severe thunderstorms across North and Central Texas tonight through early Friday morning. A short slide set is included to note the areas to be impacted, as well as the confidence.

BOTTOM LINE: Emergency Managers and elected officials should be prepared for the possibility of severe thunderstorms tonight through late Thursday night. Large hail and damaging downburst winds are expected - primarily Thursday afternoon and evening. There will also be a very small chance of a tornado or two Thursday - mainly in areas east of I-35. Thunderstorms are also possible late this evening and overnight. While a few of these may produce some hail or isolated strong winds, widespread severe weather is not expected tonight.

This latest round of thunderstorms will have plenty of lift, moisture, instability and shear to work with on Thursday. In June, this is a very favorable set of ingredients for severe weather. Decision makers - particularly along and east of I-35 - need to prepare accordingly.

IMPACTS: For Thursday afternoon and Thursday night, hail up to the size of tennis balls and downburst winds up to 70 mph will be possible. There will also be a threat for a brief tornado or two late Thursday afternoon and early Thursday evening. The overall pattern however, does not favor a tornado outbreak. Locally heavy rains Thursday may cause flooding problems

in urban areas and other flood-prone areas.

For the thunderstorms tonight, the impacts will be frequent lightning, small hail, and wind gusts up to 50 mph.

AREA OF GREATEST CONCERN: The severe weather threat area on Thursday covers all of North and Central Texas, with an enhanced threat in an area bounded by Gainesville, Fort Worth, Waxahachie, Athens, and Paris.

TIMING: The peak period of concern will be from 2 pm to midnight on Thursday.

FORECAST CONFIDENCE: There is moderate confidence that we will see a high impact scenario unfold across some part of North or Central Texas on Thursday. The enhanced threat area for Thursday depicted on the attached graphic may change in location or in size. For tonight and Thursday morning, there is overall low confidence on the severe weather potential.

ALTERNATIVE SCENARIOS: One alternative scenario is that widespread thunderstorm activity on Thursday morning will limit the amount of instability, thus limiting the amount of severe weather Thursday afternoon and evening. This has about a 30% chance of occurring.

Subject: NWS Update on Severe Weather Potential

North and Central Texas Partners,

This is a quick update on the evolving weather situation across North and Central Texas.

In short: There is STILL a potential for severe thunderstorms across portions of the area. Please stay alert.

The early morning clouds and rain have reduced - but not completely eliminated - the threat of severe weather across the northernmost counties of our area. As of now, the greateststhreat of severe thunderstorms extends along and south of a line from Eastland to Hillsboro to Palestine. The airmass in this region remains very unstable, and at least moderate wind shear exists as well. Severe thunderstorms remain possible primarily in this region - mainly after 4 pm this afternoon. Large hail, damaging winds, and even a tornado or two are possible in this area between 4 pm and 9 pm.

North of an Eastland to Hillsboro to Palestine line, the threat of additional thunderstorms is low, due to the clouds and cooler temperatures. However, there is a chance that skies will clear to an extent in this region later this afternoon, allowing temperatures to rebound and the airmass to destabilize somewhat. If this occurs, then strong thunderstorms may redevelop over this portion of North Texas late this afternoon. The overall threat in this area is much lower than it is further south, but not zero.

To recap: We still have a substantial threat of severe thunderstorms south of an Eastland to Hillsboro to Palestine line. Stay alert for large hail,

damaging winds, and even a tornado or two from about 4 pm onward today. North of the previously mentioned line, the threat has decreased significantly today, but is not zero. Jurisdictions in this area still need to keep an eye on the weather, just in case redevelopment occurs late today.

We will be providing tactical updates on NWSChat every 60 to 90 minutes through the rest of the day, posting new graphics on our web page, and posting updates on Facebook and Twitter as needed. Beyond that, please don't hesitate to call us, send me an e-mail, or post a question on NWSChat if you have any questions or specific needs.

Thanks,

Tom

I don't know if you folks in Fort Worth received this photograph from another source or not, if you did here it is again. It made at least one of the TV stations in Austin. Fortunately the tornado was in a low population area, getting to be a rare thing in Central Texas.

For the new people on my weather lists, Aaron Dooley is one of the best Storm Chasers that is a regular on our amateur radio weather nets. When I see Aaron heading out, I know it is time to activate the weather net.

Last night was perhaps the most significant weather net we have had in several years and we were able to pass information on the Watson tornado to the NWS in New Braunfels via the chat rooms since they do not monitor our repeater.

We did not receive much rain along the Chisholm Trail corridor, but the drainage areas for the dams received a good drenching.

5685. The passing of Alan R. Moller, spotter extraordinaire....

Yahoo group: Temple_ARC
Date: 2014-06-20 14:02:56 UTC
From: Joe Dorn, W5VEX
Topic: 5685 Message: 5685

Al Moller was one of the founders of the SKYWARN program and gave the advanced sessions for many years. Al was always the highpoint of the day as far as I was concerned.

I last saw Al at one of the annual SkyWarn appreciation sessions in Fort Worth shortly after he retired. I am sad to say it was obvious that the old Al was disappearing...

The NWS Fort Worth has posted a bio at:

http://www.srh.noaa.gov/fwd/?n=almoller

The following remembrance is by another icon of the early chaser community and one of my favorites, Chuck Doswell. It is long but worthy of the work that Al Moller gave to the communities...

********** THIS IS LONG **********

Thursday, June 19, 2014
The passing of Alan R. Moller
Today, I woke up to the sad news of the death of my long-time chase partner, friend, and colleague, Alan R. Moller. He finally succumbed to early-onset Alzheimer's, taken from us years before his body finally died by that cruel affliction. Seeing his razor-sharp mind and amazing memory stolen from him was difficult to endure: among his last words to me were: "Do I know you?" When I told him we'd been friends for more than 40 years, he said "That's amazing." I realized then that the man I knew was gone, and the end of his body was inevitable. I just couldn't endure seeing him that way again. It was too much for me to take. My deepest gratitude to his DFW-area friends: Sam Barricklow, Carson Eads, Tim Marshall, Ed Cohen, and others. They visited him and helped to brighten his days as the end drew near.

Fortunately, I have the memories of that long-enduring friendship to cherish. The Al Moller I knew was a wonderfully complex person, with an inquisitive, deeply-probing mind, a high-powered thinker on many topics, a person who willingly gave of his time and resources to anyone and everyone who needed them, something of a volatile temper, a wry sense of humor, often impatient but very devoted to his passions: forecasting, storm chasing, drag racing, western art, blues music, photography, and so on. For many years, I got the benefit from the extended time spent with him during our chase expeditions. I treasure that time, now. It's how I want to remember him.

When it came to his passions, Al could be very outspoken. This was something of a problem for his efforts to climb the career ladder, but he never, ever sacrificed his principles in order to avoid ruffling bureaucratic feathers. He didn't suffer incompetence or stupidity very willingly. He stayed an idealist all his life.

Anyone lucky enough to have attended one of his public presentations was in for a real treat. At the end of the formal scientific presentation, he would often put on a "bonus" slide show of his favorite images. Not just storms, but photographs of wildflowers, mountain scenery, fall foliage, ... any outdoor landscape he might encounter on his journeys. With each new image on the screen, there would be a moment of stunned silence, followed by a collective sharp intake of breath - the actual definition of what it means to be "breathtaking". His slide shows were famous, and more than worthy of that involuntary reaction. And it wasn't a case of Al bragging about his great photographs, either - he simply wanted to share the beauty he saw with others. No, those slide shows weren't showing off, but passing on the marvelous moments he'd been able to capture. Chasing with Al made me a much better photographer, as a by-product, but he was always the master.

When we chased together, it wasn't uncommon for us to get into loud, vigorous arguments - shouting matches, more or less. These never even came close to becoming a cause for us to give up our friendship. We both were stubborn, opinionated people, but with a deep mutual respect for each other. I appreciated that Al wouldn't hesitate to catch me up if he thought I'd said something stupid or incorrect. These arguments never detracted from the fun we had chasing together - chasing with Al was something I looked forward to during the time of our chasing partnership. Eventually, the time came to end that part of our relationship, but it's something I enjoyed tremendously while it endured!

Al also had a passion for public service, as well as for forecasting and severe storms. This he discussed with me during our chases together. He was profoundly committed to that, doing spotter training talks all over north TX and elsewhere - the best spotter training anyone could have asked for, dispensed with his unique style and panache. It was from him that I learned that a good forecast/warning wasn't the end of the story. There was much that had to happen after a weather forecast product left the forecast office, and Al was unshakably determined to do whatever he could to make those things happen. Al cared about people ... all people ... and did whatever it took to help them, if they needed something.

I'm proud to have known Al - he helped me, too, in many ways. His passing leaves a hole that can never be filled, but he gave us all so much - a legacy any man would be proud of, at the end. His contributions go far beyond those he touched personally - people who never knew Al, but have benefited from his huge legacy without knowing from whom the benefit originated.

This is copied from the American Radio Relay League newsletter of 26 June 2014. For those on my lists that are not amateur radio operators, the ARRL is the major 'ham' support organization.

jbdvex

SKYWARN Pioneer Alan R. Moller, N5ZCB, SK

(SK= Silent Key; ham lingo for one who has passed on.jbdvex)

National Weather Service forecaster, storm chaser, and SKYWARN <http://www.skywarn.org/> pioneer Alan "Al" Moller, N5ZCB, of Benbrook, Texas, died <http://www.dallasnews.com/obituary-headlines/20140620-national-weather-service-forecaster-and-storm-chaser-alan-moller-dies-at-64.ece> June 19. He was 64. Moller and Chuck Doswell were the primary contributors to the development of the national SKYWARN program.

Al Moller, N5ZCB.

Moller was a Senior Forecaster (retired) at the National Weather Service Fort Worth, Texas, Office, where, the NWS said, he "tirelessly worked to better understand thunderstorms and tornadoes, while at the same time teaching others to responsibly observe and report storm information from the field. He was a voice and a bridge between operational and research meteorology, and thus, was respected by both of these meteorological disciplines."

He also was a writer and cinematographer, known for StormWatch <http://www.imdb.com/title/tt0989714/?ref_=nm_ov_bio_lk1> (1995), Tornadoes: <http://www.imdb.com/title/tt1883381/?ref_=nm_ov_bio_lk2> A Spotter's Guide (1977), and Chasing the <http://www.imdb.com/title/tt1941483/?ref_=nm_ov_bio_lk3> Wind (1991). In addition, Moller enjoyed nature and landscape photography.

Moller held bachelors and master's degrees in meteorology from The University of Oklahoma. Doswell, a friend and colleague Moller met at the University of Oklahoma, described Moller as passionate about public service as well as about forecasting and severe storms.

According to his Dallas Morning News obituary <http://www.dallasnews.com/obituary-headlines/20140620-national-weather-service-forecaster-and-storm-chaser-alan-moller-dies-at-64.ece> , Doswell and Moller started a storm-chaser program in 1972, theorizing that weather observations from the field could help forecasters. This established the groundwork for SKYWARN, a volunteer program with nearly 290,000 trained

severe-weather spotters, many of them Amateur Radio licensees, who work with NWS forecasters by providing real-time observations.

Memorials may be made to the Humane Society of North Texas, 1840 E Lancaster Ave, Fort Worth, TX 76103. Read more <http://www.arrl.org/news/skywarn-pioneer-alan-r-moller-n5zcb-sk> . -- Thanks to Sam Barricklow, K5KJ

5687. Field Day

Yahoo group: Temple_ARC
Date: 2014-06-27 18:44:09 UTC
From: meseckem@...
Topic: 2324 Message: 5687

SET UP.
9:00 A.M. Saturday. We will meet at the Texas Early Day Tractor and Engine Association site in Temple, 1717 Eberhardt Rd.

TAKE DOWN.
Sunday morning around 8:00 A.M.

TARC has all the radios and antennas needed to operate.
We may need some laptop computers for logging so if you have one please bring it.

Bring insect repellent.

It will be warm but there should be a good breeze. During the day gusts up to 30 mph and at night gusts up to 25 mph. That will help keep bugs away.
Bring a fan if you think you need one.

A meal is planned for between 7:00 - 8:00 P.M.
Menu has not been set in stone so offer ideas during the day.

.

5694. 4th of July Parade

Yahoo group: Temple_ARC
Date: 2014-07-03 02:06:25 UTC
From: Darwin Geiselbrecht
Topic: 1393 Message: 5694

Once again, it is nearing time to help line up the entrants in the big July 4th parade Friday in Belton. This is a good opportunity to use our communications gear for a good cause.

I know most have helped in years past. For those who are new to the process, this is a communications exercise using hand held transceivers. If you don't have a handi-talkie, come anyway and we will pair you up with someone who does. We will use the Belton repeater on 147.3 with a 123 PL tone. This has always given us excellent coverage.

We will meet Friday July 4, at 7:30. We will meet at our usual spot in the parking lot that is at the first left off 10th street after going in the main entrance of University of Mary Hardin Baylor (UMHB) at the corner of 10th and 317. Maps and lists will be available then.

I have been told by the Chamber of Commerce that the only change from last year is that the horses will be gathered on a separate parking lot across the railroad tracks at a new UMHB maintenance facility. They will be blended with the parade on Crusader Way at the corner by the tracks. The Chamber will be responsible for this blending and will have folks stationed at the intersection point.

The chamber has promised us golf carts, so if you have a limitation concerning standing or walking, we should be able to get you in a cart.

If you have high visibility safety vests, please bring them. Otherwise, I believe Jake from the Chamber of Commerce will have some available.

We will help with the line up as soon as deployed at 8. The parade will roll at 10.

While the weather does not promise to be near 100 as usual, do bring a big hat and long sleeves. There should be water available from the Chamber of Commerce. As far as the heat is concerned, we will be complete by about 11AM before the worst part of the day.

We welcome the participation of CTARC members who make a valuable contribution to several of our outings. Please post this to any CTARC reflectors.

We some of our key people out this year, so your participation will be especially critical.

Thanks in advance for your help and see you Friday 73 - Darwin K5DOA

5696. NEW LOCATION Houston Amateur Radio Supply

5703. FW: NWS Update: Heavy Rainfall & Flooding Potential

Yahoo group: Temple_ARC
Date: 2014-09-18 16:15:11 UTC
From: Joe Dorn, W5VEX
Topic: 5703 Message: 5703
Attachments: 1 described; binary payloads are missing from this source WARC

This is a spinoff of an eastern Pacific Baja California hurricane. It will take a Gulf of Mexico hurricane to make a major impact on our lakes.

BTW, I stayed up past midnight just listening to the rain.

Joe B. Dorn, W5VEX

7969 West FM 93

Belton, Texas 76513

Home Phone: (254) 939-5918

Cell Phone:(254) 721-0829

From: Greg Patrick [mailto:gregory.patrick@...]
Sent: Thursday, September 18, 2014 7:45 AM
To: undisclosed-recipients:
Subject: NWS Update: Heavy Rainfall & Flooding Potential

Good morning...

There will be a threat of locally heavy rain across parts of north and central Texas today. The greatest threat for flash flooding will be along and south of a line from Comanche to Waco to Centerville, where a Flash Flood Watch is in effect. The watch includes the Waco and Killeen areas, but does not include the DFW area.

The graphic attached to this email depicts the heavy rain threat areas today.

A very moist atmosphere will create an environment favorable for thunderstorms with locally heavy rainfall. Any storm today across any part of north Texas could produce heavy rainfall, but we think the greatest threat of flash flooding will be across the southern areas where the storms will be most numerous. In the Flash Flood Watch area, rainfall rates of 2 inches or more per hour could cause flooding in urban areas and in small creeks and streams.

Conditions are not favorable for severe weather today or tonight. However, wind gusts up to 40 mph and frequent lightning will accompany thunderstorms.

BOTTOM LINE: Emergency Managers, elected officials, transportation/public works departments, and other public safety officials should be ready to monitor for the potential for flooding and flash flooding rains today. The

threat will be greatest in the Flash Flood Watch area.

AMOUNTS AND IMPACTS: Exact amounts of rainfall are difficult to pin down, but the potential for thunderstorms with intense rainfall rates is relatively high. The intense rainfall rates may result in flooding of small creeks and streams, and also street flooding in urban areas.

TIMING: Peak period of concern will be today, from about 10 am to 7 pm CDT. Thunderstorms will be most numerous and most intense during this time frame.

FORECAST CONFIDENCE: There is moderate confidence in this forecast.

ALTERNATE SCENARIO: A cluster of thunderstorms moved southeast across the Austin area early this morning and brought flooding rainfall. If this thunderstorm cluster persists past midday as it moves into south Texas, that would tend to lessen the threat of heavy rains across the Flash Flood Watch area.

Sent: Friday, September 19, 2014 5:42 AM
To: undisclosed-recipients:
Subject: 545 am Friday 9/19/2014 Rainfall Outlook

South Central Texas Partners...

...HEADLINE...Tropical air mass still in place, with threat of heavy rainfall again today, although it should be more isolated...

...AREA OF CONCERN...Heavy rain is possible anywhere in the forecast area, but the highest concern is for locations along and north of U.S. 290, where moderate to heavy rain has fallen since Wednesday afternoon.

...IMPACTS...Minor flooding is possible as rainfall rates of 1 to 2 inches per hour are possible with heavier storms. Rainfall will be more scattered today and average amounts of 1/4 to 1/2 inch, although a few isolated spots could receive 2 to 4 inches of rain.

...TIMING...Moderate activity is occurring this morning in metro Austin and the coastal plains to the east, with light rain over the Winter Garden area from Brackettville to Uvalde to Pleasanton. Stronger, but more scattered storms are expected from early afternoon into late evening across the entire area.

...CONFIDENCE...Moderate to High.

...DISCUSSION...The same tropical air mass is in place today, although the coverage of storms is expected to be less than earlier in the week. Rain early this morning should taper off by mid-morning, then storms redevelop by 3 pm and continue through 10 pm. The morning commute will be slow in Austin and motorists should pay close attention to closed roads or anywhere where water covers the road. the afternoon commute could be a problem across the

entire area, although storms will be spotty.

Similar to last Friday night, school and game officials should anticipate rain and possibly lightning, and discuss plans for game delays and spectator safety, including travel to and from games.

You can see the latest forecasts and watches/warnings/advisories by going to the Austin-San Antonio National Weather Service website at www.weather.gov/austin

To: Mark Fox - NOAA Federal
Subject: NWS Update: Severe Thunderstorm Potential Thursday

Good morning,

Expect one more relatively quiet and hot day today before major weather changes affect all of north and central Texas beginning Thursday.

Isolated thunderstorms will be possible in our northwest areas (e.g. Graham, Jacksboro, Bowie, and Gainesville) this evening, and again late tonight and early Thursday. These storms are not expected to be severe. However, more widespread thunderstorm activity is expected Thursday afternoon into Thursday night as a strong cold front and upper level system move into the moist and unstable airmass over the area.

Conditions will be favorable for some of the storms to become severe Thursday afternoon and Thursday night. Hail up to golfball size and thunderstorm wind gusts up to 65 mph will be the primary threats. A brief tornado will be possible late Thursday afternoon or early Thursday evening, but the overall tornado threat appears low at this time. Locally heavy rains and isolated flooding will also be possible, but the advancing cold front should keep storms moving to the east pretty quickly so widespread flooding appears unlikely.

The attached graphics depict the locations that will most likely be affected by the greatest coverage of showers and thunderstorms Thursday afternoon and Thursday night. Severe thunderstorms will be possible across ALL of north and central Texas, with the greatest chances along and especially east of Interstate 35/35W.

BOTTOM LINE: Emergency Managers, elected officials, public works departments, and other public safety officials should monitor the potential for severe thunderstorms with large hail and damaging winds Thursday afternoon and Thursday night. Continue to closely monitor the forecast for the possible issuance of watches, warnings, and advisories.

IMPACTS AND RAIN AMOUNTS: Golfball size hail and 65 mph thunderstorm wind gusts could accompany severe thunderstorms. In areas that receive rain, between one half inch and one inch of rain can be expected.

AREAS OF GREATEST CONCERN: We expect the greatest coverage of thunderstorm activity, and possibly a nearly-solid squall line, along and east of Interstate 35/35W. But there will be at least an isolated severe thunderstorm threat across all of north and central Texas.

TIMING: The peak period of concern will be on Thursday from 3 PM to 11 PM CDT. Showers and thunderstorms will end quickly from west to east Thursday night. Dry weather, with cool mornings and mild afternoons, is forecast for Friday, Saturday, and Sunday.

FORECAST CONFIDENCE AND ALTERNATE SCENARIOS: There is overall moderate to high confidence in this forecast, with a confidence factor of 8 on a 10-point scale. If the cold front moves slower than currently forecast, then more of the area west of Interstate 35 could receive strong to severe thunderstorms. If the front moves faster than currently forecast, then storm chances will be lower overall, with the greatest severe weather threat confined to the far eastern areas.

5709. It is Ham Expo Time again and as usual I will need ten to twelve ARRL VE's

Yahoo group: Temple_ARC
Date: 2014-10-02 01:29:06 UTC
From: Joe Dorn, W5VEX
Topic: 5709 Message: 5709

I am late as usual. I have been taking advantage of the weather to get some long overdue projects out of the way.

It is Ham Expo Time again and as usual I will need ten to twelve ARRL VE's to assist with the testing... I will start setting up at 9:00 on Saturday (4 October) but I will not need the VE's until about 9:30.

Visiting VE's are also welcome to participate in the session...

Show your VE badge to get into the Expo free... A breakfast will be held a week from Saturday for all of the workers and VE's that assisted with the event.

I am going to be on the floor this time since I have asked Jan and Ross to get familiar with the behind the counter operation. I am not giving up the VE operation but as I approach my 79th birthday contingencies need to be anticipated...

From: Joe Dorn, W5VEX
Topic: 5710 Message: 5710

BCC: my weather and amateur radio lists...

Most of you are probably not aware that I taught a 14 week weather course for the United States Power Squadrons (Austin unit) for several years. As a matter of fact the reason I got back into amateur radio was because of a SKYWARN session I attended while preparing to teach the course.

I recently was asked to give a Meteorology Merit Badge session for a local Boy Scout troop. I had to condense 14 weeks and the specific BSA requirements into five or six hours. It occurred to me that this, modified somewhat, might be appropriate for my amateur radio (Hams) storm spotting friends.

I will start the sessions this coming Tuesday (October 7th) at the monthly Central Texas Amateur Radio Club meeting. The meeting is held at the Bell County Communication Center/ EOC at 7:00 pm on first Tuesdays. I anticipate that it will take three or four meetings to cover the material and this should meld well with the 2015 SKYWARN sessions. CTARC has a special Christmas meeting in December so there will not be a session that month.

THIS IS NOT A SEVERE WEATHER COURSE, rather it is a very basic introduction to the atmosphere around us. I will let the NOAA SKYWARN sessions cover the exciting stuff...

I am taking the liberty of inviting all of you on my weather lists. If you are not a member of CTARC, please let me know if you plan on attending.

If I have Central Texas Master Naturalists attending, I will try to get some Advanced Training credit for you.

The Bell County Communications Center has some security requirements that we must adhere to. You will be escorted by a member of CTARC while in the facility. We normally lock the entry doors when the meeting starts so please be on time. You can call me on my cell if you arrive late and someone will meet you in the foyer.

The Bell County Com Center/EOC is located in Belton on Avenue "O" just south of the US 190 frontage road between Loop 121 and Connell.

For those of you not aware, the Bell County Emergency Operations Center has only one full time employee, the rest of the support is furnished by volunteers, most of them amateur radio operators and members of either the Bell County Reservists and/ or CTARC. (The Comm Center is staffed by full time employees.)

Now back to reading about my new 'gee whiz' Nikon D750 that should arrive tomorrow... BIG GRIN!!!!

To: undisclosed-recipients:
Subject: NWS Update: Severe Thunderstorm Potential Today and Tonight

Good morning,

As we've been discussing in previous days, strong to severe thunderstorms still remain a threat across most of North and Central Texas this afternoon and this evening, as as a strong cold front and upper level trough approach our area from the west. We still expect isolated storms to develop along the Red River and in Western North Texas late this morning through midday, with a more concentrated line of storms evolving and moving across all of North and Central Texas this afternoon and evening.

Large hail and damaging winds will be the primary threats, as well as the ever-present lightning risk. While the overall tornado threat will be low, a brief tornado or two is not completely out of the question late this afternoon or early this evening. Locally heavy rains and isolated flooding will also be possible, but the advancing cold front should keep storms moving to the east pretty quickly so widespread flooding appears unlikely.

The attached graphic depicts our latest thinking regarding the location and timing of the thunderstorms today. Severe thunderstorms will be possible across ALL of our region today, with the greatest chances north of Interstate 20, and especially along and east of Interstate 35/35W.

BOTTOM LINE: Emergency Managers, elected officials, public works departments, and other public safety officials should monitor the potential for severe thunderstorms with large hail and damaging winds Thursday afternoon and Thursday night. As always, there are a number of important outdoor events across the area this afternoon and this evening. Please

continue to closely monitor the forecast for the possible issuance of watches, warnings, and advisories that may affect these events, and all activities in North and Central Texas.

PRIMARY IMPACTS AND RAIN AMOUNTS: Golfball size hail and 65-70 mph thunderstorm wind gusts could accompany severe thunderstorms. In areas that receive rain, between one half inch and one inch of rain can be expected over a period of 30-60 minutes. Remember also - lightning can remain a threat ahead, and even an considerable distance behind a main line of storms that affects a given location.

AREAS OF GREATEST CONCERN: We expect the greatest coverage of strong-severe thunderstorm activity, and possibly a nearly-solid squall line, along and east of Interstate 35/35W. But there will be at least an isolated severe thunderstorm threat across all of North and Central Texas today.

TIMING: The peak period of concern - area-wide - will be on Thursday from 130 PM to 10 PM CDT. Locations west of I-35/I-35W are more likely to be affected between 130 pm and 4 pm , while areas east of the I-35 corridor will likely experience thunderstorms after 3 pm this afternoon.

Showers and thunderstorms will end quickly from west to east Thursday evening. Dry weather, with cool mornings and mild afternoons, is forecast for Friday, Saturday, and Sunday.

FORECAST CONFIDENCE AND ALTERNATE SCENARIOS: There is overall moderate to high confidence in the locations and timing of this forecast, with a confidence factor of 8 on a 10-point scale. If the cold front moves slower than currently forecast, then more of the area west of Interstate 35 could receive strong to severe thunderstorms this afternoon.

To: undisclosed-recipients:
Subject: Strong to Severe Storms Possible Late Afternoon & Tonight

South Central Texas Partners...

...HEADLINE...

Strong to Severe Storms Possible Late Afternoon & Tonight

...AREA OF CONCERN...

Slight Risk for Severe Storms roughly along and north of a Kerrville to
Wimberly to Giddings line. Strong storms possible south of this line.

...IMPACTS...

* Storms in the severe risk will be capable of producing damaging
winds up to 70 mph, large hail up to golfball size, isolated tornadoes, and
dangerous cloud-to-ground lightning.
* Stronger storms, south of the above mentioned line, will be capable
of producing strong wind gusts up to 50 mph, small hail, and dangerous
cloud-to-ground lightning.
* Rainfall amounts along and east of I-35: 1/4 to 1/2 inch, isolated
2 inches.
* Rainfall amounts west of I-35: 1/4 inch or less.

...TIMING...

Hill Country and Central Texas: 5-9 PM

San Antonio Metro & I-10 Corridor: 8 PM - Midnight

...CONFIDENCE...

Moderate

...DISCUSSION...

A cold front will move into South-Central Texas this evening. Isolated to scattered showers and storms will develop across the northern Hill Country late this afternoon in advance of the cold front. The showers and storms may fill into a line as the front moves east of I-35 during the mid and late evening hours. Conditions for severe storms will be most favorable across the Hill Country and Central Texas, although stronger storms can not be ruled out farther south. Rainfall amounts and the speed of the front will generally preclude the threat for widespread flash flooding across the area, although isolated, heavier downpours are possible. Drier air will move into the area from north to south between midnight and 6 AM Friday.

You can see the latest forecasts and watches/warnings/advisories by going to the Austin-San Antonio National Weather Service website at <http://www.weather.gov/austin> www.weather.gov/austin

Subject: NWS UPDATE: Overnight Thunderstorms

Good morning,

There will be the threat of strong to severe thunderstorms late this evening through the overnight period as an upper level disturbance approaches our area from the northwest. The storms are expected to develop between Wichita Falls and Abilene after 9 PM and move southeast through the overnight hours.

Large hail will be the primary threat along with cloud to ground lightning. Some locally gusty winds and heavy rain will be possible.

The attached graphics depict our latest thinking regarding the location and timing of the thunderstorms today. Severe thunderstorms will be possible mainly north of a Goldthwaite to Waco to Athens line.

BOTTOM LINE: Emergency Managers, elected officials, public works departments, and other public safety officials should monitor the potential for severe thunderstorms with large hail tonight. Some clean-up activities and power outages continue in some areas. As these storms will occur overnight, storms will be occur after dark, impacts on outside personnel will be minimal. Please continue to closely monitor the forecast for the possible issuance of watches, warnings, and advisories that may affect these events, and all activities in North and Central Texas.

PRIMARY IMPACTS AND RAIN AMOUNTS: Quarter to half-dollar size hail and wind gusts to around 50 mph may accompany some of the thunderstorms. In areas that receive rain, between one half inch and one inch of rain can be expected over a period of 30-60 minutes. Remember that lightning can remain

a threat ahead, and even a considerable distance behind a main line of storms that affects a given location.

AREAS OF GREATEST CONCERN: Isolated to scattered storms will move across North and Central Texas overnight tonight into Monday morning. The greatest threat of severe weather will be north of a Goldthwaite to Waco to Athens line.

TIMING: Areas northwest of a Sherman to Weatherford to Comanche line between 9 PM and 1 AM. The storms will move southeast affecting areas northwest of a Canton to Temple before daybreak and mainly areas to the southeast after 7 AM.

FORECAST CONFIDENCE AND ALTERNATE SCENARIOS: There is a moderate confidence in the locations and timing of this forecast, with a confidence factor of 6 on a 10-point scale.

From: Mark Fox - NOAA Federal [mailto:mark.fox@...]
Sent: Sunday, October 12, 2014 2:09 PM
To: Mark Fox - NOAA Federal
Subject: NWS UPDATE: Severe Thunderstorm Potential Overnight

Good afternoon,

Ignore your calendar for the next 30 hours. While it is indeed October, the next storm system tonight is reminiscent of an early spring system and has the potential of widespread severe weather. There are a few areas that will see showers and thunderstorms this afternoon (if not right now), but these are not anticipated to be severe. The main concern will be the storms developing and moving in tonight. A short PDF has been included to graphically depict the main areas of concern and risks from weather.

BOTTOM LINE: Emergency Managers, elected officials, public works departments, and other public safety officials be prepared for another round of severe thunderstorms during the overnight hours tonight. This system could produce a multitude of severe weather reports, primarily damaging winds and large hail. There is the possibility of tornadoes and flash flooding with this system, with the added complication of these occurring during the overnight hours.

PRIMARY IMPACTS AND RAIN AMOUNTS: The system tonight is expected to produce a large squall line. Ahead of the line there is a possibility of isolated supercells which could produce any combination of: damaging winds, large hail, and a tornado. With the squall line the risks will be damaging winds and large hail, with the possibility of embedded tornadoes. There is the possibility of power outages tonight and Monday morning. Heavy rain

could cause a few flooding issues, especially in the traditional spots that fill up with water quickly. This could impact the morning commute on Monday.

AREAS OF GREATEST CONCERN: Severe thunderstorms are possible just about anywhere in the Fort Worth area of responsibility overnight tonight. The greatest risk of severe thunderstorms will be areas north of a line from: Bowie.to Cleburne.to Canton. See the attached graphics for a better visualization of the areas at risk.

TIMING: West of I-35/35W, severe storms could begin as early as this evening. The squall line is expected to develop around Midnight, before moving east and exiting the area before Noon Monday.

FORECAST CONFIDENCE AND ALTERNATE SCENARIOS: There is a moderate to high confidence in the locations and timing of this forecast, with a confidence factor of 7 on a 10-point scale.

The main question with this forecast revolves around the development of isolated storms or supercells ahead of the squall line. If isolated supercells occur ahead of the main line of storms, areas could be impacted by these supercells first and then another round of severe weather with the squall line. If the isolated storms do not develop or do not impact your particular jurisdiction, the severe threat remains with the squall line. The tornado potential is uncertain as well, but there is a threat for at least isolated tornadoes with this system.

5715. A bad day in Red Cross

Yahoo group: Temple_ARC
Date: 2014-10-29 16:11:02 UTC
From: kevinmccoy@...
Topic: 5715 Message: 5715

Well, we are getting beaten up today by NPR. They got a copy of our lessons learned from Hurricane Sandy and are beating us up with it.

But it is a good day. Let me tell you about a bad day in Red Cross - its when you respond to a house fire and an innocent died.

It is so pointless because a child has a 60% improved chance of surviving a fire if there is a working smoke detector. This quarter we are going starting a new program. We will pilot canvasing high incident zip codes to see if we can get more smoke alarms installed and more batteries tested.

You can help in your communities starting with "Fall Back" at your home, ARES organization, and community. Get those Smoke Alarm Batteries replaced AND TESTED. Teach your children and grand children to get out and get to safety, where to meet.

We did a survey recently and folks responded their belief that they had 5 minutes to exit a fire. The truth is closer to 2 minutes. There is no time to think, the reason to drill is that it becomes automatic. If you drill the kids the whole family learns, and you can prevent a very bad day.

We are moving into the season when we start seeing a lot of home fires. This is a great time to make sure that the furnace is clean and tested in the light of day. Space heaters are away from flammable objects and house wiring is safe.

If you are ready, your household is ready, and your organization is ready, then there is a much better chance you will be available to help us when the time comes.

Thank you for being ready.

Sent: Sunday, November 02, 2014 1:14 PM
To: undisclosed-recipients:
Subject: Heavy rain event possible over South Central Texas Tuesday-Wednesday

South Central Texas Partners...

...HEADLINE...

...Locally heavy rainfall expected across South Central Texas from Tuesday afternoon through Wednesday morning...

...AREA OF CONCERN...

All of South Central Texas, but the highest totals as of right now are forecast along and east of the I-35 corridor....including the Austin and San Antonio metro areas.

...IMPACTS...

* Locally heavy rains of 1-3 inches, isolated totals of 4-5 inches.

* Highest totals along and east of I-35 corridor.

* High rain rates, in excess of 1-2 inches of rain per hour.

* Increased flows on creeks and low water crossings with some Flash Flooding possible in both urban and rural areas.

* Strong thunderstorms with dangerous lightning and high wind gusts.

Due to the ongoing drought across most of south central Texas, area lake, reservoir and river levels are low. At this time, flooding of main stem rivers is not expected, although river levels will likely rise given the expected rainfall amounts.

...TIMING...

The heavier rainfall is expected to occur Tuesday afternoon through Wednesday afternoon especially along and east of the Interstate 35 corridor. As a cold front enters the Hill Country and southern Edwards Plateau on Tuesday, showers and thunderstorms will initially be favored along and north of a Del Rio to Burnet line between 3 and 8 PM Tuesday. As the cold front moves southward, the focus for heavy rainfall will move into the Interstate 35 corridor between 8 PM Tuesday through 6 AM Wednesday morning. As the cold front continues to push south, the concern for heavy rain will shift east of Interstate 35 between 6 AM - Noon Wednesday. Timing of the heavy rainfall could change, so please monitor the latest forecasts for more information.

...CONFIDENCE...

Moderate-High

...DISCUSSION...

An approaching upper level storm system and cold front combined with increasing moisture from the Gulf of Mexico and the eastern Pacific will lead to widespread rains across South Central Texas on Tuesday and Wednesday. Light rainfall may begin as early as Monday for areas west of I-35. However, the heavier rainfall is expected to occur Tuesday afternoon through Wednesday morning, especially along and east of the Interstate 35 corridor. The concern for heavy rainfall will begin to decrease Wednesday afternoon as the cold front moves south of the region.

Please keep "weather aware" over the next few days as forecasts and the timing of the front/upper level system are fine tuned.

You can see the latest forecasts and watches/warnings/advisories by going to the Austin-San Antonio National Weather Service website at <http://www.weather.gov/austin> www.weather.gov/austin

I have blown the dust and cob webs out of my CoCoRaHs rain gauge in anticipation of two days of rain but I won't be counting the drops until they are in the collection tube.

There are some good graphics attached.

Subject: NWS UPDATE: Widespread Rainfall and Potential Flooding

Good afternoon,

Widespread rainfall is heading to northern and central Texas. Not much is anticipated in the way of severe weather, but most of the region will see beneficial rainfall over the next two days. There is a short pdf attached that shows forecast rainfall amounts, impacts, and confidence.

BOTTOM LINE: Emergency Managers, elected officials, public works departments, and other public safety officials should monitor the weather beginning early Tuesday morning through late Wednesday. Widespread rainfall will occur for most of the area. There will be a few spots of localized heavy rainfall, which could cause nuisance flooding.

PRIMARY IMPACTS AND RAIN AMOUNTS: Impacts from this storm system will mainly be beneficial. However, traditional low lying areas, construction zones, and quick rising creeks will likely flood.

AREAS OF GREATEST CONCERN: It is difficult to pinpoint exact areas that will/will not flood, so all areas will need to be aware of the potential for flooding. However, our current forecast amounts do suggest that White Rock Creek in Dallas to come to minor flooding stage. Other areas that traditionally briefly flood during heavy rainfall will need to be monitored as well.

Generally speaking, the heaviest rainfall is expected from I-20 to the south.

TIMING: The front is expected to move into north Texas early Tuesday morning, as early as 6 am...and move slowly south. Lingering light rain will occur through 6 AM to Noon Wednesday.

FORECAST CONFIDENCE AND ALTERNATE SCENARIOS: There is a moderate to high confidence in the locations and timing of this forecast, with a confidence factor of 9 on a 10-point scale.

The timing and the forward speed of the front are still in question. If the front continues to slow, there could be heavier rainfall amounts in spots to the north.

From: ki5m@...
Topic: 5721 Message: 5721

If you have not paid already for the December meeting Christmas Party you may pay your $5 per person at the door. To have a good headcount please send a message to "Board@tarc.org" stating your call sign and how many people you will pay for.

If you wish to pay your 2015 membership, the preferred method is to use the MEMBERSHIP link on http://www.tarc.org http://www.tarc.org

Membership may also be paid at the January club meeting: $15 for 65 and older; $20 full membership for younger folks. A member may add the entire family for an additional $10 for them to be family members.

The Christmas Party will be at the Temple Knights of Columbus. I believe Myron will send out a directions map due to work on highway I-35.

If you wish to (or your spouse) help with the decorations, contact Jan Gregg, also available by Email using Board@tarc.org for an Email address.

See you there !

Subject: Freezing temperatures expected across all of South Central Texas Tonight

South Central Texas Partners...image attached.

...HEADLINE...Freezing temperatures expected across all of South Central Texas tonight...Hard freeze in the Hill Country

...AREA OF CONCERN...All of South Central Texas

...IMPACTS... Freeze sensitive plants, animals, pets will be susceptible under these cold conditions. Exposed pipes may freeze.

...TIMING...Temperatures are forecast to drop below freezing by this evening in the Hill Country, and the rest of South Central Texas after midnight. Temperatures will remain below freezing through mid morning on Friday.

...DISCUSSION...

The arctic air continues its hold on South Central Texas. A widespread freeze is expected, for most areas it will be the first freeze this winter season. Some record low temperatures are possible (see attached image). Make sure you have taken and completed the necessary precautions to protect plants, pipes, and pets. Some areas in the Hill Country could see 12 hours of freezing temperatures. Wind chill readings Friday morning may be in the mid to high teens across the coldest areas. Thermometers will start to show

warming temperatures shortly after sunrise and by mid morning, much of the area will be above freezing.

You can see the latest forecasts and watches/warnings/advisories by going to the Austin-San Antonio National Weather Service website at <http://www.weather.gov/austin> www.weather.gov/austin

Subject: NWS UPDATE: Weekend Forecast

Good afternoon,

Yes, the "S" word is in the forecast. (snow). There will be an upper level disturbance that moves across the area Sunday afternoon and evening that may produce a few areas of snow. A short pdf has been attached to show the affected areas, confidence and anticipated impacts.

BOTTOM LINE: Emergency Managers, elected officials, public works departments, and other public safety officials should monitor the potential for a few snow flurries Sunday and Sunday night. No impacts are anticipated or expected at this point.

PRIMARY IMPACTS AND RAIN AMOUNTS: Most areas will see no impacts from this storm. Snow flurries and a mix of rain and snow could cause a few bridges or overpasses to have a few slick spots.

AREAS OF GREATEST CONCERN: Areas north of a line from Goldthwaite to Canton could see a few snowflakes.

TIMING: Rain could begin as early as Sunday morning, but any rain mixed with snowflakes will be late in the day on Sunday and into Sunday night.

FORECAST CONFIDENCE AND ALTERNATE SCENARIOS: There is a moderate to high confidence in the locations and timing of this forecast, with a confidence factor of 8 on a 10-point scale. There are few alternate scenarios with the forecast, as little accumulation is anticipated. However, we can say with 90% confidence, that the snowfall will be less than one inch.

Sent: Saturday, November 15, 2014 5:00 PM
To: undisclosed-recipients:
Subject: NWS UPDATE: Winter Weather Potential Sunday

Good afternoon,

We're still following the evolution of an upper level disturbance that will sweep across North Texas Sunday and Sunday night. The system will arrive with moderate lift and moisture. Coupled with a reinforcing shot of cold air, this disturbance may trigger scattered showers of rain mixed with - and in some areas changing - to light snow. A short pdf has been attached to show the affected areas, confidence and anticipated impacts.

BOTTOM LINE: Significant impacts ARE NOT expected with this system, but a few slick spots could occur in our northern and northwest counties where the chance of measurable snow is a little greater. Emergency Managers, elected officials, public works departments, and other public safety officials in North Texas should monitor the potential for snow Sunday and Sunday night and be prepared to respond to potential slick spots.

PRIMARY IMPACTS AND AMOUNTS: Most areas will see no impacts from this storm. However, light snow - possibly accumulating up to 1/2 inch - could cause a few bridges or overpasses to have temporary slick spots Sunday afternoon and evening. Air temperatures will remain in the lower to middle 30s across North Texas into late afternoon, with readings dropping below freezing in the northwest counties after sunset. Any precipitation that falls will have a good chance of evaporating due to strong north winds later Sunday night.

AREAS OF GREATEST CONCERN: Areas north of a line from Eastland to Sherman will have a greater chance of seeing a light snow accumulation and possible slick spots. Slick spots in the DFW Metroplex - and areas east and south - are very unlikely.

TIMING: Rain could begin as early as Sunday morning. Any snow that develops will appear initially over western North Texas in mid-afternoon, and over the rest of North Texas between 4 pm and Midnight. Most of the precipitation should end from west to east across North Texas during the evening, before air temperatures have a chance to dive appreciably before freezing.

FORECAST CONFIDENCE AND ALTERNATE SCENARIOS: There is a moderate to high confidence in the locations and timing of this forecast, with a confidence factor of 8 on a 10-point scale. The main alternative scenario would be that the system produces little or no snow at all, due to a lack of moisture and cold air. We can say with 90% confidence that any snowfall that occurs will be less than one inch.

As usual, if you have any concerns, please do not hesitate to contact us.

Tom

Subject: NWS UPDATE: Thunderstorms late this week and Saturday

Good afternoon,

We wanted to send a brief message to everyone with regard to a major weather system that will affect all of north and central Texas later this week and this weekend. The day of primary impacts, Saturday, is still 3 days away, so we'll be sending additional updates with more details on Thursday afternoon and again Friday afternoon.

A very strong weather system will move across Texas on Saturday. Rain and thunderstorm chances will begin late Thursday, and continue through Saturday night. The good news is that widespread rainfall over 1 inch is expected in many areas of north and central Texas. The bad news is that severe thunderstorms are possible, mainly late Friday night into Saturday. And a few areas may receive locally heavy rainfall that causes flooding. This event is not expected to produce a severe weather outbreak or widespread excessive rainfall. But isolated reports of flooding, large hail, and damaging winds are expected.

BOTTOM LINE: Emergency Managers, elected officials, public works departments, and other public safety officials should monitor the latest forecasts, especially for the Friday night into Saturday evening period.

To: undisclosed-recipients:
Subject: NWS UPDATE: Thunderstorm Threats Friday and Saturday

Good afternoon,

Widespread shower and thunderstorm activity will affect north and central Texas beginning Friday and lasting into Saturday night. Severe thunderstorms and locally heavy rain are expected. A major severe weather outbreak is not expected, but several reports of damaging wind, large hail, and perhaps a few tornadoes are expected. Locally heavy rains may cause flooding problems in urban areas and other flood prone locations, but ongoing drought conditions suggest that widespread flooding or flash flooding is unlikely.

A short presentation is attached that shows the areas impacted and confidence levels. Thunderstorms are expected to be widespread on Saturday as the influence of a very strong upper level system moves across the region.

BOTTOM LINE: Emergency Managers, elected officials, public works departments, and other public safety officials should monitor the potential for severe thunderstorms and heavy rainfall, especially late Friday into Saturday night. Nearly all areas will be affected by thunderstorms at some point during this time frame, so lightning will be a primary threat. All areas will have at least a low end threat of severe thunderstorms, but the severe weather threat will be higher in southern areas around Waco, Temple, Killeen, Hearne, and Centerville on Saturday.

PRIMARY IMPACTS: Large hail up to golfball size and wind gusts over 60 mph will be the primary severe weather threats. A tornado or two will be possible, mainly on Saturday, but the greater tornado threat is forecast to

remain in southeast Texas. Locally heavy rains of up to 3 inches could cause flooding problems, especially if the heavy rains fall in urban areas or other flood prone areas.

FORECAST CONFIDENCE AND ALTERNATE SCENARIOS: There is moderate confidence in the locations and impacts mentioned in this forecast, with a confidence factor of 7 on a 10-point scale. An alternate scenario for Saturday is related to the amount of unstable air in place for severe thunderstorm development. If the overall speed of the system is slower and/or the thunderstorms are not widespread on Saturday, then greater instability could lead to a more significant severe weather episode.

I cannot open the newsletter from either of these two urls I had no trouble opening the documents you sent. For some reason (unknown to me) I had no trouble with Mike’s notice, but I’ve never been able to open one from your notices.

Thanks again fro sending the pdf file.

5739. Temple Christmas Parade

Yahoo group: Temple_ARC
Date: 2014-11-26 20:27:14 UTC
From: meseckem@...
Topic: 297 Message: 5739

Monday December 1st.
Meet at 3:30 P.M. in the parking lot behind the Bell County Health Department on 8th street in Temple.

Staging starts at 4:00 P.M.
Weather outlook is for temperatures in the mid 60s with only a slight chance of rain.
Helpful items to bring with you are something to write with, flash light, clip board,

I will have maps and instructions to hand out when you show up. But if you want them earlier you can download them from the Yahoo group. Look under Files/Temple Christmas Parade.

Subject: SKYWARN Recognition Day

Hello everyone,

Attached is the announcement for Skywarn recognition day for 2014. The event will be held at the NWS office in Fort Worth on Saturday, December 6th. This is an opportunity for the amateur radio operators (and others) to come by the office to see the other side of things, and give us an opportunity to say thanks.

Visitors are welcome, but we do need to have anyone that would like to be there RSVP. Details on this are in the attached PDF.

Please forward this to your group's amateur radio operators.

Thanks.

Mark

5742. Christmas Parade Forecast

Yahoo group: Temple_ARC
Date: 2014-12-01 02:05:47 UTC
From: meseckem@...
Topic: 5742 Message: 5742

Mostly cloudy, 40 degrees with 20 mph winds.
70% humidity but little chance of rain.
Might wish to wear layered clothing.

The plan is to have everyone park on the north side of the avenues at their assigned intersection.
This will allow a place to get out of the wind for short periods of time.
You can also keep your clothing, supplies, food and drink near you without having to carry it.

Bring a safety vest if you have one.

Date: 2014-12-02 18:56:59 UTC
From: meseckem@...
Topic: 5743 Message: 5743

Just another reminder that the annual TARC Christmas Dinner is this FRIDAY December 5th. It was first reported to be the regular Thursday meeting night but we forgot about Thursday night bingo at KC Hall.

Time is 7:00 P.M.

5744. FW: Harsh Winter Ahead

Yahoo group: Temple_ARC
Date: 2014-12-03 15:23:48 UTC
From: John Hobson
Topic: 5744 Message: 5744

All,

Joe has been trying to keep us up to date on the lates NWS forcasts with the final results sometime being much different from the predictions..

Received the story below from a friend. Good weather prediction advice.

Enjoy. 73

John WD5BFS

It's late fall and the Indians on a remote reservation in South Dakota asked their new chief if the coming winter was going to be cold or mild.

Since he was a chief in a modern society, he had never been taught the old secrets. When he looked at the sky, he couldn't tell what the winter was going to be like.

Nevertheless, to be on the safe side, he told his tribe that the winter was indeed going to be cold and that the members of the village should collect firewood to be prepared..

But, being a practical leader, after several days, he got an idea. He went to the phone booth, called the National Weather Service and asked, 'Is the coming winter going to be cold?'

'It looks like this winter is going to be quite cold,' the meteorologist at the weather service responded.

So the chief went back to his people and told them to collect even more firewood in order to be prepared.

A week later, he called the National Weather Service again. 'Does it still look like it is going to be a very cold winter?'

'Yes,' the man at National Weather Service again replied, 'it's going to be a very cold winter.'

The chief again went back to his people and ordered them to collect every scrap of firewood they could find.

Two weeks later, the chief called the National Weather Service again. 'Are you absolutely sure that the winter is going to be very cold?'

'Absolutely,' the man replied. 'It's looking more and more like it is going to be one of the coldest winters we've ever seen.'

'How can you be so sure?' the chief asked.

The weatherman replied, 'The Indians are collecting firewood like crazy.'

Remember this whenever you get advice from a government official!

5745. A Christmas gift to the folks on my weather distribution lists

Yahoo group: Temple_ARC
Date: 2014-12-20 03:54:29 UTC
From: Joe Dorn, W5VEX
Topic: 5745 Message: 5745

This is my Christmas gift to the folks on my email lists that get my weather dispatches.

I have three computers and six monitors set up in a "U" around me. I bring all three up in the morning and have them set to display different weather and conservative political items as they initialize. This explains why you will see several things mentioned as items I look at first. During major weather events I will have all 6 screens displaying weather and spotter information.

This is a digest of what I have chosen as critical information after running or being active on Spotter weather nets since 1996.

You can listen in to the Amateur Radio Weather Nets at 145.310 on a scanner or any 2 Meter amateur radio receiver. If you have a ham license we encourage you to participate if you are in a severe weather situation. WE COULD CARE LESS ABOUT WHAT YOU SEE ON LOCAL TV. THAT IS OLD INFORMATION FOR US.

I encourage the folks attending my CTARC weather classes to play with these before the next meeting.

Lynn. If you think it is worthwhile, forward to the Master Naturalists.

The NWS SKYWARN classes start in January, an excellent introduction to severe weather. The general public is encouraged to attend. The Bell County class will be in Belton on February 14th, Valentines Day. Bring your significant other and take her/him/it to lunch at Miller's BBQ, rated one of the best in Texas, and two blocks from the meeting location.

Several, perhaps most, of the items below require a 'refresh' to get the most current information

If any of the URL's don't work, please advise me. I have tested them on 2 computers but I might have a setting I have forgotten about.

HI HO Rudolf.and Away we go.

Graphic Current Conditions and Forecast

This is the first view of the NWS forecast that I check in the morning. I have it set to show Temple, you can change it to another location.

<http://forecast.weather.gov/MapClick.php?CityName=Temple&state=TX&site=FWD&textField1=31.0977&textField2=-97.3635&e=0#.VJKnCXu2peO>
http://forecast.weather.gov/MapClick.php?CityName=Temple&state=TX&site=FWD&textField1=31.0977&textField2=-97.3635&e=0 - .VJKnCXu2peO

National Weather Service Enhanced Radar Image Loop

This is a large scale composite of all of the Lower 48 radars. This is one of the first things I check in the morning.

You can use the side and bottom bars to drag the map around or you can click on a location and get the nearest local radar.

I love looking at the northerners getting covered up with global warming.

<http://radar.weather.gov/ridge/Conus/full_loop.php>
http://radar.weather.gov/ridge/Conus/full_loop.php

National Weather Service Weather Forecast Office Fort Worth/Dallas

This is my main source of information about what is projected by the almighty computers, quite often in error for Bell County but the best info we have and the data that is fed to the media mythologists. It is one of my initial browser screens.

http://www.srh.weather.gov/fwd/

National Weather Service Weather Forecast Office Austin/San Antonio

I check this quite often when the systems are moving in from the south or southwest.

The Fort Worth NWS bunch often forgets we are part of their CWA (County Warning Area) and I go here and check on the Georgetown area for better information from EWX. The DFW area is the main concern for FWD but EWX has the Austin area to worry about. Our weather follows the Austin patterns more often than the Dallas area.

<http://www.srh.weather.gov/ewx/> http://www.srh.weather.gov/ewx/

APRS.FI

APRS.FI is a display program for the Automated Packet (Position) Reporting System. APRS was designed for amateur radio operators.

I use it to track storm spotters during major weather events. You can enter ham call signs or city names for tracking. As sent, it is set for Belton. You do not have to be an amateur radio operator to access this.

http://aprs.fi/
<http://aprs.fi/#!addr=Belton%2C%20TX&mt=m&z=11&timerange=10800> -
!addr=Belton%2C%20TX&mt=m&z=11&timerange=10800

There are APRS apps that allow you, amateur radio operators, to input your position via 'smart' devices. I use APRSDroid. There are also apps that allow connection to EchoLink.

GRLevel3 Version 2 (GRL3.2)

GRLevel3 2.00 <http://www.grlevelx.com/grlevel3_2/> GRLevel3 Version 2 is a Windows viewer for live and archived NEXRAD Level III radar data. It displays high resolution base products, dual polarization products, and derived products along with Local Storm Reports and severe weather warnings.

This is the source for the radar display program of choice for most of the amateur meteorologists. You can download it for a free trial period (I recommend you wait until the spring weather systems start moving so that you can see it in action.) There is a lot of help available, local and on the internet, to set it up.

I have multiple copies of GRL3.2 running during major outbreaks, perhaps my most essential program.

<http://www.grlevelx.com/> http://www.grlevelx.com/

There is a three dimensional GR Level 2 program that is absolutely amazing in showing major storm systems. It is a bit more expensive but very much fun. It has a free trail period that you might want to take advantage of during the tornado season.

The GR (Gibson Ridge) programs have a one time charge for personal use and free data feeds thereafter. There is an add-on for the feeds from AllisonHouse that has a yearly charge attached. AH adds a lot of good data feeds but because of the cost I do not recommend it for most of you. I would not be without it.

You have seen this program, GR2Analyst 2.00 <http://www.grlevelx.com/gr2analyst_2> , on The Weather Channel and the NWS uses it. It is that good!

BTW, I have not looked at The Weather Channel or local TV (of any sort) in several years. Our spotters are the source for much of what you see broadcast and I don't need the hype of local TV.

PYKL3 Radar

Perhaps the most advanced Android weather radar display app and my choice. Similar to GRL3 on the desktop.

<http://www.pykl3radar.com/> http://www.pykl3radar.com/

CoCoRaHS

CoCoRaHS is an acronym for the Community Collaborative Rain, Hail, and Snow Network.

Several of us in the area participate in the CoCoRaHS program. You have to have a special accruate rain guage and make daily rain/precipitation reports. I have the input URL come up on one of my computers as it initializeds each morning so that I don't forget to make the report.

<http://cocorahs.org/Content.aspx?page=aboutus> http://cocorahs.org/Content.aspx?page=aboutus

Earth Wind Patterns

This is perhaps my favorite always up site; an absolutely beautiful display of the surface wind patterns. It is my 'screen saver'.

Great for locating tropical systems (hurricanes, typhoons, willy-willys etc.) and low/high pressure systems. You can watch the systems as they move about. It is one of the very best tools for learning wind patterns.

You can drag and expand to any location on earth. I have sent a centered version on the areas we are most concerned with. This is fun to play with.

<http://earth.nullschool.net/#current/wind/surface/level/orthographic=-101.12,33.62,489> http://earth.nullschool.net/ -current/wind/surface/level/orthographic=-101.12,33.62,489

Lower 48 Wind Patterns

This was the inspiration for the earth view above and gives a better display of the lower 48 wind patterns... I have it as a first thing on one of my computers.

http://hint.fm/wind/

I have access to a couple of other programs that are not open to the general public such as the NWS chat room and Hurrivac. You will hear me mention these on occasion but I can not get you into the programs.

If you have any questions hit me on the repeater or send an email.

Merry Christmas!!!

And may all of your Christmases be warm and cheerful with bluebirds singing and the streets ice free.

Subject: FW: Rudolph: The true story

From: Larry Cole
Subject: FW: Rudolph: The true story

I never knew this, did you?

A good story when good things happen to good people.

The True Story of

Rudolph

A man named Bob May, depressed and brokenhearted, stared out his drafty apartment window into the chilling December night.

His 4-year-old daughter Barbara sat on his lap
Quietly sobbing. Bob's wife, Evelyn, was dying of cancer.

Little Barbara couldn't understand why her mommy could never come home. Barbara looked up into her dad's eyes and asked,

"Why isn't Mommy just like everybody else's Mommy?" Bob's jaw tightened and his eyes welled with tears. Her question brought waves of grief, but also of anger. It had been the story of Bob's life. Life always had to be different for Bob.

Small when he was a kid, Bob was often bullied
By other boys. He was too little at the time to compete in
Sports. He was often called names he'd rather not remember.

From childhood, Bob was different and never seemed to fit in. Bob did complete college, married his loving wife and was grateful to get his job as a copywriter at Montgomery Ward during the Great Depression. Then he was blessed with his little girl.

But it was all short-lived. Evelyn's bout with cancer stripped them of all their savings and now Bob and his daughter were forced to live in a two-room apartment in the Chicago slums. Evelyn died just days before Christmas in 1938.

Bob struggled to give hope to his child, for whom he couldn't even afford to buy a Christmas gift. But if he couldn't buy a gift, he was determined to make one -
A storybook!

Bob had created an animal character in his own mind and told the animal's story to little Barbara to give her comfort and hope. Again and again Bob told the story, embellishing it more with each telling. Who was the character? What was the story all about?

The story Bob May created was his own autobiography in fable form. The character he created was a misfit outcast like he was. The name of the character? A little reindeer named Rudolph, with a big shiny nose. Bob finished the book just in time to give it to his little girl on Christmas Day.

But the story doesn't end there.

The general manager of Montgomery Ward caught wind of the little storybook and offered Bob May a nominal fee to purchase the rights to print the book. Wards went on to
Print, "Rudolph, the Red-Nosed Reindeer" and
Distribute it to children visiting Santa Claus in their
Stores. By 1946 Wards had printed and distributed more than six million copies of Rudolph.

That same year, a major publisher wanted to purchase the rights from Wards to print an updated version of the book.

In an unprecedented gesture of kindness, the CEO of Wards returned all rights back to Bob May. The book became a best seller. Many toy and marketing deals followed and Bob May, now remarried with a growing family, became wealthy from the story he created to
Comfort his grieving daughter.

But the story doesn't end there either.

Bob's brother-in-law, Johnny Marks, made a song adaptation to Rudolph. Though the song was turned down by such popular vocalists as Bing Crosby and Dinah Shore , it was recorded by the singing cowboy, Gene Autry.

"Rudolph, the Red-Nosed Reindeer" was released in 1949 and became a phenomenal success, selling more records than any other Christmas song, with the exception of "White Christmas."

The gift of love that Bob May created for his daughter so long ago kept on returning back to bless him again and again.

And Bob May learned the lesson, just like his dear friend Rudolph, that being different isn't so bad. In fact, being different can be a blessing.

MERRY

CHRISTMAS

Enjoy life... It has an

Expiration

Date!

Coldsnap: 3 Feet of protected space! Space heaters are 30% of fires but 80% of DEATHS. #txwx @CenTexRedCross
http://www.redcross.org/prepare/disaster/home-fire
http://www.redcross.org/prepare/disaster/home-fire

This season we are seeing a lot of fires and a lot of multi-unit apartment fires. In our region we see about two fires per day. That has been as many as 8 to 10 per day when a cold snap hits.

Want to double your chances of escaping? Check that smoke detector.

Subject: National Weather Service Update: Potential Winter Weather Event Wednesday and Thursday

Good afternoon,

We have a complicated winter weather forecast on our hands as approach the New Year's. An arctic airmass will set up shop across the region Tuesday through Thursday, while light precipitation forms over the top of this dome of cold air. While we don't expect a major event, we DO think there will be at least some travel impacts within North Texas on Wednesday and Thursday. Attached is a set of slides highlighting this upcoming event.

BOTTOM LINE: Road travel impacts due to ice - particularly on bridges and overpasses - are possible over North Texas Wednesday through Thursday. Areas along and west of the Interstate 35 corridor are at greatest risk. Our confidence in the development of significant icing and travel impacts is currently moderate, with the main uncertainty being the duration of sub-freezing surface temperatures. Emergency Managers, elected officials, public works departments, and other public safety officials should monitor this approaching weather system very closely, and be prepared to respond accordingly as New Year's Eve approaches.

PRIMARY IMPACTS AND AMOUNTS: Freezing rain, possibly mixed with a little sleet. Bridges, overpasses, and elevated surfaces would be at the greatest risk for travel impacts. Any ice accumulations will likely remain less than 0.15". While widespread power outages are not expected, some spotty outages could occur, particularly if winds approach 15 mph west of the Metroplex. Some airport weather delays or cancellations could also occur.

AREAS OF GREATEST CONCERN: We are most concerned about areas along Interstate 20 west to Cisco/Eastland (including Ranger Hill), and other locations southwest through northwest of Fort Worth. In these areas, surface temperatures are more likely to remain in the 29 to 33 degree range Wednesday through Thursday as light rain moves into the region. This will increase the chances of ice formation on bridges, overpasses, and some roadways.

Farther east, mainly along and east of the Interstate 35 corridor, temperatures are a bit more likely to stay around or slightly above freezing. Some patchy freezing rain is possible in the Gainesville, Denton, and Dallas/Fort Worth areas Wednesday night and Thursday, but impacts - if any - are expected to be spotty, and limited to a few bridges and overpasses.

TIMING: The time period of greatest concern is 12 pm Wednesday through 6 pm Thursday.

FORECAST CONFIDENCE AND ALTERNATE SCENARIOS: Our overall confidence in the forecast is moderate, with our greatest uncertainty being the onset and duration of sub-freezing surface temperatures across the area.

We have moderate to high confidence that light rain will occur late Wednesday and Thursday. While there is a very small chance that the arctic airmass will be deeper and colder, leading to more widespread/significant icing impacts, there is a greater chance that temperatures will remain at or above freezing in most locations. If this latter scenario occurs, then very little, if any icing will occur in North and Central Texas.

Subject: NWS Update: Winter Weather Impacts Wednesday and Thursday

Good afternoon,

Arctic air is now pushing into Texas, and the storm system we've been discussing for the past few days is taking shape to our west. We're now getting a bit better picture of how moisture, lift and temperatures will likely converge to produce ice-related travel impacts over North and Central Texas through Thursday. Attached is a set of slides highlighting this upcoming event.

BOTTOM LINE: We still expect light rain and drizzle to spread from west to east across North and Central Texas Wednesday through Thursday morning. With temperatures hovering in the upper 20s and lower 30s, we believe some icy spots - mainly on bridges and overpasses - will evolve west of the I-35 corridor by Wednesday evening. We're more optimistic now about the prospects of avoiding a major winter event for most of our area. However, there likely WILL be some ice-related travel impacts through New Year's Day morning - particularly along the I-20/US-287/US-377 corridors west of Fort Worth. Emergency managers, elected officials, public works departments, and other public safety officials should continue to monitor this weather system very closely, and be prepared to respond accordingly as New Year's Eve approaches.

PRIMARY IMPACTS AND AMOUNTS: Freezing rain and drizzle. Bridges, overpasses, and elevated surfaces would be at the greatest risk for travel impacts. Any ice accumulations will likely remain less than 0.15", with the greatest amounts occurring in the western part of North Texas. Some airport weather delays or cancellations are possible through Thursday. Some spotty power outages might occur well west of the Metroplex, but widespread interruptions are not expected.

AREAS OF GREATEST CONCERN: We remain most concerned about areas along the Interstate 20 corridor from Weatherford, west to Cisco (including Ranger Hill). Other locations west of a Bowie to Granbury to Copperas Cove line are at the greatest risk of receiving accumulating ice. In these areas, surface temperatures are more likely to remain in the 27 to 33 degree range Wednesday through Thursday as light rain moves into the region. This will increase the chances of ice formation on bridges, overpasses, and some roadways.

Farther east to the Interstate 35 corridor, temperatures are more likely to stay around (or abovev) freezing during the precipitation event. Some patchy freezing rain is possible in the Gainesville, Denton, and Dallas/Fort Worth areas Wednesday night and Thursday, but impacts - if any - are expected to be very spotty, and limited to a few bridges and overpasses.

TIMING: Some freezing precipitation could begin in the west as soon as Wednesday morning. The time period of greatest concern is 6 pm Wednesday through Noon Thursday.

FORECAST CONFIDENCE AND ALTERNATE SCENARIOS: Our overall confidence in the forecast remains moderate, with our greatest uncertainty continuing to be the onset and duration of sub-freezing surface temperatures across the area. We have moderate to high confidence that light rain will develop late Wednesday and Thursday. While a small chance still exists that temperatures will come in colder than expected (and hence, icing will be more widespread), we think there's a better chance that temperatures will remain very close to freezing in most locations, severely limiting any ice formation in North and Central Texas.

Eula et al.

The Bell County SkyWarn session will be at the Belton ISD complex on 2nd street across from the Belton Feed Store. I will be putting out more detailed info as the time approaches.

BTW, I will be giving the 3rd installment of my quickie weather class at the upcoming CTARC meeting on the next first Tuesday at the Bell County EOC. All are welcome.

Subject: NWS UPDATE: Early Wednesday Morning

Good morning,

Expect a few more tactical emails today, as things may / may not change.

Bottom Line: We are quite concerned about the colder than anticipated temperatures. Overnight, precipitation will occur across north and central Texas, and this will likely occur while temperatures are near, or well below freezing. Ice accumulations are expected on exposed surfaces as far east as the DFW Metroplex, and Waco/Temple/Killeen/Fort Hood/.

Impacts: Ice accumulation on bridges and overpasses at least. Temperatures below freezing for many outdoor events tonight. Any ice accumulations will not go anywhere tomorrow, as temperatures will remain close to, or below freezing .

Below is a snapshot of the current temperatures, as of 8 AM. The areas that are at/below freezing now...will likely be at or below freezing for much of the day. Temperatures may briefly increase this afternoon, but temperatures are not anticipated to increase much today.

By tonight, especially after Midnight, precipitation will begin to increase from wets to east. The Winter Weather warning area may increase in coverage this afternoon, and the Winter Weather Advisory has increased to cover the entire metroplex, and now covers the entire I-35 corridor (Including both I-35W and I-35E).

More to come later today, as additional data becomes available to us.

Subject: NWS Update: Noon Thoughts

Good morning again everyone,

Not a whole lot of changes to the thinking based on the current data. Temperatures have warmed a degree or two since 8, but we still have the freezing line cutting through the Metroplex, and just west of the I-35 corridor in central Texas. At 11 AM, the freezing line cut from Sherman, to Burleson, to Fort Hood (and areas west).

Attached are slides that show the general thinking.

Bottom Line: precipitation expected to increase in both intensity and coverage overnight. The worst of winter impacts are still expected to be west of U.S 281, with some impacts as far east as I-35/I-35E.

Impacts:

West of U.S. 281 : slow travel due to freezing rain and ice. Power outages likely

East of U.S. 281 to I-35/35E : minor ice accumulations on elevated surfaces. Spotty power outages possible.

East of I-35/35E: a few slick spots, otherwise liquid precipitation.

All areas: Cold temperatures for outdoor events.

Please let us know if you have any further questions.

Mark

Over the last year Home Fires outweighed all other disaster types combined. Red Cross helped 62,762 families financially - representing about 210,000 folks served.
On the preparation side we installed more than 17,000 smoke detectors.
In terms of larger disasters it was a relatively quiet year with only the Amarillo Wild Fire affecting Texas.
We have a Disaster Relief effort in progress currently in San Antonio with more than 100 Seniors in temporary housing. (http://www.mysanantonio.com/news/local/article/Fire-breaks-out-at-senior-living-community-5981971.php http://www.mysanantonio.com/news/local/article/Fire-breaks-out-at-senior-living-community-5981971.php)
Speaking of which - Our senior discount means we are twice as likely to die in a fire. Watch http://youtu.be/3xv8bdKhBno http://youtu.be/3xv8bdKhBno and live. Men about twice as probably as women. Get low and go. If you are lucky you have less than two minutes. Call 911 AFTER you get outside.
Remember – ARES IS THE Red Cross communication partner in disasters. Our national perspective reminds us that it can and will happen here.
Thank you for helping us stay ready.
Kevin DST / @KF5FUZ CSTAR Region Texas American Red Cross @CENTEXREDCROSS

BCC: my SKYWARN and other mailing lists.

****

This is the first (and probably only) time I have used my email lists for this type of email, however I strongly feel the silent citizens of this country need to stand up and let their voices be heard over the noise of the crowds.

Since most of the people on my email lists are amateur radio operators, I would like to point out that BPD Assistant Chief Mike Rhoden is also W5MIK and has assisted us with the VE testing program.

****

During this time of vitriol, unrest and outright hatred directed toward the police departments and their members around the country, I would like to pass this newsletter on. It is a publication of the Belton PD auxiliary, "C.H.I.P.S.", and the "Belton Citizen's Police Academy Alumni". I am a member of both.

Under the leadership of Chief Gene Ellis., the BPD has developed into one of the most community oriented police departments in the entire country and in my opinion the very best in Texas. Take a moment to look at the newsletter and appreciate the community we live in.

I would encourage you to join in one of the citizens training classes around the area however I believe the Belton 2015 class is already full. If enough of you hounded Chief Ellis, he might be persuaded to have a second 'academy' this year, otherwise you can get on the waiting list for 2016.

NOTE: The academy is open to Belton area folks and there is no obligation to become a member of C.H.I.P.S. It is well worth your time to attend. If you wish to join the C.H.I.P.S program, an additional training class is required. Background checks are required.

Give a 'Thumbs Up' any time you pass an officer on patrol.

Subject: Weather Update 4PM...increasing chances for frozen precipitation overnight Tonight...Continued chances Fri Night-Saturday

South Central Texas Partners...

...HEADLINE...

Chances for Frozen Precipitation late Tonight and early Friday...and again Friday Night/Saturday.

...AREA OF CONCERN...

* Cold Arctic Air - All of South Central Texas. Temperatures well below average are expected into the weekend.
* Frozen Precipitation Late Tonight/Friday Morning into Friday Afternoon: Mainly the northern and northeast sections of South Central Texas. Best chances are (Along and north of Highway 71 including Austin and portions of I-35 corridor)
* Frozen Precipitation Friday Night/Saturday: All of South Central Texas including portions of the I-35 Corridor (Including Austin and San Antonio).

...TIMING...

* Cold Arctic Air - Arctic Air will remain in place through Saturday. Slow warmup into next week although temps will still likely be below normal.

* Frozen Precipitation - Chance for frozen precipitation will be highest Friday night into the first half of Saturday. However, weather models are increasing chances of light rain/sleet late tonight from midnight through Friday AM (mainly across the north and northeast sections of South Central Texas) This chance of light rain/sleet will continue on Friday during the day across the northern half of the area although temperatures should be slightly above freezing to limit overall impacts. Will continue to monitor this closely.

...IMPACTS...

* Frozen Precipitation Friday AM - Light rain/sleet over the northern half may create minor travel issues Friday morning. This needs to be monitored closely. This will be highly dependent on the type of precipitation and intensity. Not out of the question that travel delays could occur along with bridges/overpasses being impacted.

* Frozen Precipitation Friday Night into Saturday - Travel impacts are possible across much of South Central Texas. Some light ice accumulation is possible.

* Cold Arctic Air - Protect the Pipes, Plants, and Pets. Highs only in the 30s and 40s on Friday. Will stay in the 30s all day on Saturday. Some areas on Saturday may struggle to get above freezing, especially over the Hill Country and northern areas.

Inline image 1

...CONFIDENCE...

* Precipitation Occurring - High
* Frozen Precipitation Occurring and Area - Low to Moderate

...DISCUSSION..

Seems like even more questions today as the weather models are trying to figure things out. We have increased precipitation chances late tonight into Friday AM across the northern half of the area as models are showing a band of precipitation forming overnight mainly along and north of Highway 71...including Austin. Temperatures will be close to freezing overnight in this area and there could be some accumulation of light ice and sleet. Too early to tell just how much or where...but some travel impacts could occur for Friday morning in this area. Residents will need to monitor the weather closely and even possibly wake up a bit earlier to check on road and travel conditions in your area.

Most areas are expected to go above freezing on Friday, but scattered sleet/rain showers are still possible. Overall I think travel impacts will be minor during the day with most areas seeing some scattered cold rain areas. Again the far northern areas would see the best chances for seeing some additional light frozen precipitation and minor travel impacts.

The upper level storm finally moves toward Texas Friday night into Saturday. With an additional surge of cold air coming on Friday, this will once again

set the stage for possible frozen precipitation across much of South Central Texas late Friday night into the first part of Saturday. Light ice accumulations are possible with some travel delays/impacts expected...just cannot pinpoint exactly where. Lingering precipitation Saturday night into early Sunday may continue a small threat for additional icing, but chances are even lower.

There remains a whole lot of questions with this forecast...dry air, when the precipitation will start, how much will fall, and will it be even below freezing if and when the precipitation arrives. We will continue to try and fine tune the forecast. At some point over the next 48 hours, we could issue a Winter Weather Advisory for portions of the area...and it may come at the last minute especially if we start getting widespread frozen precipitation reports. Again, we are mainly focusing on Friday AM across the northern areas...and Friday Night-Saturday AM for all of South Central Texas where we could see ice impacts.

You can see the latest forecasts and watches/warnings/advisories by going to the Austin-San Antonio National Weather Service website at: <http://www.weather.gov/austin> www.weather.gov/austin

Another update will come out Friday Morning. Sooner if necessary. Be diligent and monitor roads and conditions closely.

Stay Warm!

Subject: NWS UPDATE: Winter Weather Potential

Good afternoon,

Several weather systems will bring precipitation chances to north and central Texas through the weekend. The first system will arrive late tonight and Friday and will affect mainly southern sections. The second system will arrive late Saturday and will bring good precipitation chances, mainly a cold rain, to many areas. The threat for winter weather will end by mid morning on Sunday as temperatures rise above freezing and all precipitation after that falls as a cold rain.

A short pdf has been attached to show the affected areas, confidence and anticipated impacts.

BOTTOM LINE: Emergency Managers, elected officials, public works departments, and other public safety officials should monitor for the potential of winter precipitation from late tonight into Sunday morning. Check on the forecast often, as the forecast temperature trends will dictate whether or not significant impacts will occur in any given area. Widespread significant winter weather impacts are NOT forecast across north or central Texas at this time, but a few areas can expect to receive at least minor impacts with slick bridges and overpasses.

PRIMARY IMPACTS: The primary impacts expected would be the development of slick spots on bridges and overpasses in areas that receive a period of freezing rain, sleet or snow. Minor ice accumulation can be expected on trees and shrubs in areas that receive a period of freezing rain.

AREAS OF GREATEST CONCERN: The primary area of concern for late tonight into Friday will be in areas south of Interstate 20. The primary areas of concern for Saturday night into early Sunday morning will be in the western and northern sections of north Texas where temperatures will be coldest.

TIMING: Most of the precipitation will occur in two rounds: 1) late tonight into Friday, and 2) Saturday night into Sunday. The greater coverage of precipitation, some of which may fall as freezing rain, will be Saturday night and Sunday.

FORECAST CONFIDENCE AND ALTERNATE SCENARIOS: There is moderate confidence in the locations and timing of this forecast, with a confidence factor of 5 on a 10-point scale.

The alternate scenarios are mainly tied to temperature trends on Saturday night and Sunday morning. If temperatures are 3-5 degrees colder than we are currently forecasting, then there will be a much higher potential for significant impacts. Likewise, if temperatures are 33 or higher when the steady rainfall begins, then few impacts would occur.

Subject: NWS UPDATE: Winter Weather Potential

Good afternoon,

The overall chances for winter weather impacts across any part of north and central Texas have diminished since yesterday's forecast. Isolated, short-lived impacts are still possible this weekend, but the threat of widespread significant winter weather impacts is very low.

A short pdf has been attached to show the affected areas, confidence and anticipated impacts.

We are still expecting a precipitation event for the Saturday night into Sunday night period. Most of the precipitation will fall as a cold rain, with temperatures forecast to be above freezing during the bulk of the event. However, isolated pockets of sleet and freezing rain will be possible in many areas, especially Saturday night. A few impacts can be expected if sleet or freezing rain occurs and temperatures are at or below freezing. Isolated cloud to ground lightning strikes are also possible Saturday night as a few thunderstorms develop across the area.

BOTTOM LINE: Emergency Managers, elected officials, public works departments, and other public safety officials should monitor for the potential of winter precipitation from this evening into early Sunday morning. Check for forecast updates, as the forecast temperature trends will dictate whether or not impacts will occur in any given area. Widespread significant winter weather impacts are NOT forecast across north or central Texas at this time, but isolated areas could receive impacts with a few slick bridges and overpasses.

FORECAST CONFIDENCE AND ALTERNATE SCENARIOS: There is moderate confidence in this forecast overall, with a confidence factor of 7 on a 10-point scale. The alternate scenarios are mainly tied to temperature trends from Saturday into Sunday morning. If temperatures are 5 degrees colder than we are currently forecasting, then there will be a higher potential for significant impacts. Likewise, if temperatures remain in the mid 30s or higher when the steady rainfall begins, then few or no impacts would occur.

From: Mark Fox - NOAA Federal [mailto:mark.fox@...]
Sent: Wednesday, January 21, 2015 1:11 PM
To: Mark Fox - NOAA Federal
Subject: NWS UPDATE: Rainfall and Winter Precipitation Potential

Good afternoon,

Beneficial rainfall is coming for most of the area, while some areas could see some snow. A short pdf has been attached to show the affected areas, confidence and anticipated impacts.

BOTTOM LINE: Emergency Managers, elected officials, public works departments, and other public safety officials should monitor the specific forecast for their jurisdictions closely for the rest of the week. The entire area will see rain, while areas to the west and northwest of the DFW metroplex could see snow and a mixture of rain and snow. Temperatures are critical, yet are currently forecast to be above 32 degrees, even during wintry precipitation.

PRIMARY IMPACTS: Slick spots on roads, especially elevated surfaces are possible. (See slide 3 for the breakdown of areas impacted) Windy conditions on Thursday may cause additional impacts, such as spotty power outages or tree damage. Impacts are anticipated to be on the low end of the scale, with snow accumulating on grassy and elevated surfaces. On the positive side, most areas should receive between ¾ and 1 ½ inch of rainfall.

AREAS OF GREATEST CONCERN: The primary area of impacts are anticipated to be relatively narrow, north of a line from Breckenridge, to Jacksboro, to Sherman.

TIMING: Rain will begin tonight. Rain should begin mixing with snow in the northwest as early as Thursday morning in the northwest. Rain could mix with

snow for more of the area by Friday morning.

FORECAST CONFIDENCE AND ALTERNATE SCENARIOS: There is moderate to high confidence in the locations and timing of this forecast, with a confidence factor of 7 on a 10-point scale. Most of the impacts are expected to be on the low side

Alternate scenarios: Alternate scenarios depend one of two things: the air temperature and any banded precipitation. Get nervous if your temperature drops below 29 degrees, or if the current NWS forecasts begin talking about banded precipitation for your area. The likelihood of going below 29 is low, while there is a higher possibility of banded snowfall in the area of greatest concern.

Subject: NWS UPDATE: Rain & Rain/Snow Mix

Good afternoon,

After a night of localized heavy rainfall, tonight will be a little quieter. However, the precipitation is not quite over yet. The precipitation will not end until the upper level storm passes, which should be during the middle of the night tonight. Attached is a short pdf has been attached to show the affected areas, confidence and anticipated impacts.

BOTTOM LINE: Emergency Managers, elected officials, public works departments, and other public safety officials should monitor the specific forecast for their jurisdictions closely tonight and early tomorrow. We are currently anticipating a mixture of rain and snow for much of the area during the overnight hours. Temperatures are critical, yet are currently forecast to be above 32 degrees, even during wintry precipitation. Additionally, the localized heavy rainfall will continue for the rest of the afternoon across Central Texas, which could lead to isolated minor/urban flooding.

PRIMARY IMPACTS: Most areas have already seen at least ¾☐ of rainfall from last night and this morning. While there is a possibility of additional snow, rain mixed with snow, and/or brief sleet (or any combination of the above): temperatures above freezing should keep impacts to a minimum. Impacts from wintry precipitation are not expected to be widespread. Left over water on roadways (or elsewhere) tonight is not expected to freeze overnight.

AREAS OF GREATEST CONCERN: There is only a small area where we are currently forecasting air temperatures to be near 32 degrees. This area is along and north of a line from Breckenridge to Bowie.

TIMING: Rain continues in Central Texas for the bulk of the afternoon. The heavier areas of precipitation on radar will slowly move northeast and east through 8 PM. Between now and then, what you see is what you get: a few areas of light rain or rain/snow mix ☐ with temperatures in the mid to upper 30s. Overnight, the upper level system will produce additional light rain or rain/snow mix (again, temperatures in the mid-30s).

FORECAST CONFIDENCE AND ALTERNATE SCENARIOS: There is high confidence in the locations and timing of this forecast, with a confidence factor of 9 on a 10-point scale. Any impacts are expected to be on the low.

Alternate scenarios: Alternate scenarios depend mainly on the air temperatures. Watch your temperature closely, as impacts would begin if your temperature drops below 29 degrees. The likelihood of going below 29 is quite low.

Good afternoon everyone,

Very brief update on the weather for next week: There is a high likelihood that the cold air and/or winter weather is not done with us yet. We are becoming more confident that cold air will return next Monday/Tuesday (16th/17th) and there could be precipitation with it.

There are way too many uncertainties to begin discussing precipitation types or amounts. However, please closely monitor the weather forecasts through the weekend for more information.

Overview of Possibilities

Cold air moving back into the region: high

Any precipitation: moderate

Winter Precipitation: low - moderate
(this will be area dependent)

Known areas to be affected: low

Major Winter Storm? Low

Details are quite important with a winter storm. Those details are too far out in time to see yet. Our plan is to update this information with more details as the days go by. So, no decisions are necessary at this point, other than to continue monitoring the forecast.

Subject: NWS Update: Winter Weather Potential Early Next Week

Good afternoon everyone,

We continue to monitor a developing storm system that will bring precipitation and colder air to North and Central Texas early next week. While there is some potential that snow will accompany this system, our overall confidence in any winter impacts is LOW.

BOTTOM LINE: While we are still several days out, we do not anticipate a significant winter storm in North and Central Texas early next week.

Based on the guidance we have this afternoon, we DO expect widespread light to moderate rain to occur across North and Central Texas starting Monday and continuing through Tuesday afternoon. Temperatures should also turn quite a bit colder starting Monday afternoon and continuing into Wednesday. On Tuesday, temperatures north of I-20 will average in the mid to upper 30s, while readings south of I-20 will linger in the upper 30s to mid 40s.

Right now, we have low to moderate confidence that temperatures in the lower atmosphere will cool sufficiently for some light snow to mix in with the rain across North Texas on Tuesday. With surface temperatures expected to remain above freezing, we don't anticipate any travel impacts, though some light accumulations (under 1") on grassy areas might occur north of an Eastland to Jacksboro to Gainesville line Tuesday. In the worst case scenario, surface temperatures would drop several degrees colder than we currently expect them to, and the upper level lift would be much stronger. This would result in bands of snow that would accumulate on area roads and cause slick conditions later in the day Tuesday. Right now, we think this

is a very unlikely possibility.

All of the precipitation should taper off and end from west to east across the area Tuesday afternoon and evening. Overnight lows Tuesday night and Wednesday morning will drop below freezing across all of North and Central Texas, so any residual moisture on area roads could conceivably freeze and cause some slick spots by Wednesday morning.

We will provide another update by midday Friday, with further updates through the weekend as needed.

Tom

Subject: NWS Update: Winter Weather Potential Early Next Week

Good afternoon,

We continue to monitor a developing storm system that will bring precipitation and colder air to North and Central Texas early next week. The latest change from our thinking yesterday is that we may face two rounds of possible winter precipitation Monday and Tuesday. While a significant winter storm IS NOT expected for our area, we do have some confidence that at least some freezing snow and/or light snow could develop Monday and Tuesday. The attached graphic depicts are current thinking.

BOTTOM LINE: Emergency Managers, elected officials, public works departments, and other public safety officials should monitor for the potential of winter precipitation from late Sunday night through Tuesday. Some minor ice impacts to bridges, overpasses, and even some roadways could occur in counties closer to the Red River early Monday morning. Please check the forecast frequently this weekend, as adjustments could occur with later model guidance. Another update will be issued via e-mail early Saturday afternoon.

PRIMARY IMPACTS: Freezing rain would be the primary potential impact with this storm. An arctic cold front will move into Texas Sunday evening. Between midnight and 8 am Monday morning, surface temperatures over North Texas could dip into the 28 to 34 degree range. Light rain will also move into the area early Monday. If it arrives quickly enough, it may coincide with the sub-freezing temperatures and produce some light icing of elevated

surfaces, including bridges and overpasses, by daybreak Monday. Accumulations of ice should be quite light - generally less than 0.10". Any light freezing rain that develops should end from west to east by late morning Monday, with air temperatures recovering into the mid 30s by afternoon.

Another potential impact could be light snow, which has the potential of falling across North and Central Texas late Monday night and early Tuesday morning. With air temperatures mostly remaining in the lower to middle 30s Monday night/Tuesday morning, any accumulations that do occur would be confined to grassy surfaces, with no travel impacts.

Finally, temperatures overnight Tuesday night into Wednesday morning will dip into the upper 20s and lower 30s in areas north of Interstate 20. Any residual moisture on roadways/bridges north of this line could be subject to some freezing, resulting in a few slick spots Wednesday morning.

AREAS OF GREATEST CONCERN: The primary area of concern for any icing impacts would be north of a Breckenridge to McKinney to Paris line early Monday morning, with those counties immediately adjacent to the Red River facing the greatest potential. While some isolated and very light icing on exposed/elevated surfaces is not completely out of the question for the DFW Metroplex and elsewhere along Interstate 20, no appreciable travel impacts are expected in these areas.

Light snow will be possible north of a Goldthwaite to Athens line Tuesday morning. Accumulations, if any, would be primarily confined to the counties closest to the Red River.

TIMING: An arctic front will sweep through North and Central Texas Sunday evening, ushering in gusty north winds and colder temperatures. Light rain should begin across the area after midnight Monday morning, with the potential for a changeover to freezing rain between 2 am and 6 am in our northernmost counties. The rain or freezing rain should end in all areas by 10 am Monday. The potential for light snow will begin in the west around 10 pm Monday night, and continue through 10 am Tuesday.

FORECAST CONFIDENCE AND ALTERNATE SCENARIOS: We have low to moderate confidence in the development of some light freezing rain - resulting in a few impacts to bridges and overpasses - over our northern counties early Monday. We ARE confident that surface travel impacts, if any, in the DFW area would be minimal We have low confidence that an additional round of light snow would produce any accumulations over North Texas late Monday night/Tuesday morning.

Right now, we feel our temperature and precipitation forecast is on the cooler and wetter side of the spectrum. We think it's unlikely that low temperatures Monday morning will go even lower than what we are currently predicting. There is a somewhat better chance that the actual readings will be slightly higher than forecast, thus leading to less icing - or no icing at all - in our northern counties.

It is also possible that the convergence of moisture, lift and temperature will not be sufficient for any snow to develop over North Texas early Tuesday morning. An alternate scenario of heavier snow - with accumulations - is considered extremely unlikely.

BCC: my weather lists

This is a reminder that the 2015 Bell County SKYWARN session is tomorrow February 14, Saint Valentines Day. The location is at the Belton ISD office complex, follow the people to the presentation area. The offices are located at 2nd and Wall in Belton. Take the Central Avenue exit from IH-35., then:

From the north turn like you are going to The Burger King.

From the south go past the Sonic on Central Avenue and turn north for two blocks.

If you are coming the 317 route, turn east onto 2nd street at the stop light by the Bell County Historical Museum.

The ISD complex is roughly across from the Belton Feed Store...

Note: The Texas Master Naturalist get AT credit for the session.

Subject: NWS UPDATE: Rain and Potential for Freezing Drizzle

Good afternoon,

Warm temperatures remain across much of the region this afternoon, with colder air not too far away in Oklahoma. Rain will gradually move in from the west and southwest, before the cold air begins to filter into north and central Texas tonight. A short PDF has been attached to show the general timeline of events.

BOTTOM LINE: There is a possibility of a mixture of rain, freezing rain/drizzle for areas to the north and northwest of the DFW metroplex late tonight and early Monday. Emergency Managers, elected officials, and public safety departments should be prepared for the possibility for slick bridges and overpasses in areas generally west of I-35/35W...and north of Interstate 20.

PRIMARY IMPACTS: In the impacted areas, there will be the possibility of light icing on trees and power lines, which could lead to spotty power outages. There will also the possibility of slick spots on bridges and overpasses.

AREAS OF GREATEST CONCERN: The primary area for concern will be north and west of a line from Cisco to Sherman. Just about everyone will see precipitation, but most of us will only see a cold rain during the overnight hours and Monday.

TIMING: Rain has already begun in the western counties, and will become more widespread late this afternoon and tonight. The next round of cold

temperatures and precipitation moves south of the Red River around Midnight and will then continue to move southward. The highest potential for freezing rain and freezing drizzle in the NW will be before 7 AM Monday, with freezing drizzle continuing as late as 9 AM.

FORECAST CONFIDENCE AND ALTERNATE SCENARIOS: There is high confidence in the locations and timing of this forecast, with a confidence factor of 8 on a 10-point scale. The impacts are expected to be minor, with any ice being mainly on elevated surfaces. Afternoon temperatures on Monday are expected to reach the upper 30s and lower 40s,

In the areas where freezing rain and drizzle are anticipated:

- Expected temperatures during precipitation: 30 to 32

- Expected wind speeds during (and right after) precipitation: North 20-25 with gusts to 25-30

Subject: NWS UPDATE: Winter Weather Possible Early Next Week

Good afternoon everyone,

We're looking closely at some weather changes we expect to occur over North and Central Texas in the Sunday and Monday time frame. These changes will place us back into a wintertime pattern, bringing colder temperatures and the potential for winter precipitation (sleet or freezing rain, most likely). While it's too far out to pinpoint precise details, we believe impacts to travel and power MAY occur over portions of North and Central Texas from late Sunday into Monday. Attached is a quick set of graphics outlining our current thoughts.

I say "MAY" because there's still a lot of uncertainty with this system. We talk frequently about the ingredients for winter precipitation consisting of: 1) moisture, 2) lift, and 3) a favorable temperature profile. At this early stage of the forecast, we're fairly confident that temperatures will be cold enough to produce winter impacts (unlike last Monday's minor event). However, there's still quite a bit of uncertainty as to how much moisture and lift will be available over North and Central Texas while the cold airmass is in place. So, while it may be cold, the jury is still out as to whether the lift and moisture will be sufficient to produce freezing rain or sleet. And if so - how much? We will start to get a better handle on these questions as we go through the next 24-48 hours.

Here's the Bottom Line: It is too soon to say this will be a significant winter event for North and Central Texas, or to identify specific impacts.

However, all of our government, emergency management, media, and associated partners - and the general public - DO need to start watching the forecasts closely from now through the weekend.

We will be focusing on this event very closely, and providing additional updates tomorrow and through the weekend. In the meantime, please don't hesitate to contact our office, or Mark Fox or me directly.

Subject: NWS Update: Winter Weather Impacts Sunday Night and Monday

Good afternoon,

Our confidence is increasing that winter weather will bring travel impacts to parts of north and central Texas by early Monday morning. The attached graphics give information on areas that have the greatest potential for winter weather impacts Sunday night into Monday. The area of north Texas with the greatest potential for impacts is along and north of a line from Comanche to Dallas to Bonham. This afternoon, a Winter Storm Watch will be issued for portions of north Texas for Sunday night and Monday.

BOTTOM LINE

Winter weather impacts can be expected across parts of North Texas late Sunday through midday Monday. The Dallas and Fort Worth areas, as well as areas north and west from there, are within the area that has the greatest potential for impacts. Hazardous travel conditions will be possible, but are not yet a certainty, for the Monday morning commute. The impacts will be related mainly to accumulating sleet, but some freezing rain is possible. With very cold air in place, some areas could have lingering impacts into Monday night and Tuesday even though the precipitation will diminish by Monday afternoon.

Freezing rain amounts may also be substantial enough to cause at least spotty power outages across north and central Texas Sunday night and Monday.

Temperatures through most of the day Monday will likely remain at or below freezing, so the potential for melting may be limited. Sub-freezing

temperatures are likely Monday night/Tuesday morning.

CONFIDENCE AND ALTERNATE SCENARIOS

Our confidence level that some areas will receive impacts from sleet and freezing rain is moderate to high, with a confidence level of 7 on a scale of 10. The exact amounts of sleet and freezing rain in any given area are still uncertain. Our current thinking is that most of the winter precipitation will fall as sleet, but there is also some potential for freezing rain to contribute to ice accumulation totals in some areas.

We will be focusing on this winter weather event very closely, and providing additional updates through the weekend. If you need additional information, contact our forecasters 24/7 using your usual means.

Subject: NWS Update: Winter Weather Impacts Sunday Night and Monday

Good morning,

We're sending out an update this morning, with the intention of distributing a slightly longer message later this afternoon, once today's guidance is received and assessed by our forecasters.

Our initial cold front is now sweeping southward through North Texas this morning, and a reinforcing shot of arctic air will impact our region tonight and Sunday. With this cold air fully in place by Sunday evening, we're still confident that we'll have winter precipitation - and thus, winter travel impacts - across most of North and Central Texas late Sunday night and Monday. The primary change this morning is that we've expanded our Winter Storm Watch southward to a line roughly extending from Lampasas to Waco to Athens.

BOTTOM LINE

Winter weather impacts can be expected across parts of North Texas late Sunday through midday Monday. The Metroplex remains within the area that has the greatest potential for surface and aviation travel impacts. Within the watch area, we still expect most of the precipitation to fall as sleet, mixed to varying degrees with freezing rain. We don't believe precipitation totals will be nearly as great as those experienced during the December 6-7, 2013 ice event. Nevertheless, surface temperatures will be sufficiently

cold for up to half an inch of sleet and freezing rain to accumulate on many roads and bridge surfaces, forming a slick glaze by Monday morning. The ongoing pre-treatment of some major highways should obviously mitigate these impacts, however. Counties south of the watch area also need to remain cautious and prepared, as some icing may occur Monday, particularly on bridges and overpasses. Additional watches and advisories may be issued for these areas as we approach the event.

Be prepared for temperatures to remain at or below freezing across a large part of North Texas on Monday. Coupled with a lack of sunshine, this will limit any melting that might otherwise occur. We don't expect temperatures to rise above freezing until late morning Tuesday.

Given the strong trends toward sleet at the expense of freezing rain, we don't currently expect any widespread power outages. Freezing rain totals may be great enough in a few areas to cause at least spotty power outages across north and central Texas Sunday night and Monday, however.

CONFIDENCE AND ALTERNATE SCENARIOS

Our confidence that some areas will receive impacts from sleet and freezing rain is high, now up to an 8 on a scale of 1 to 10. The exact amounts of sleet and freezing rain in given areas are still somewhat uncertain, however. Our current thinking is that up to one half inch of sleet will occur in many areas, coupled with up to one tenth inch of freezing rain. However, if the storm system is able to sustain locally greater amounts of lift, then the precipitation amounts (and impacts) may increase as well. We will begin to get a better handle on sleet and freezing rain amounts later today and Sunday.

We will closely assess the data that comes in today, and provide an additional update (with graphics) later this afternoon. In the meantime, if you need additional information, please refer to our office's home page, or contact our forecasters 24/7 using your usual means.

Thanks,

Tom

From: Mark Fox - NOAA Federal [mailto:Mark.Fox@...]
Sent: Sunday, February 22, 2015 11:50 AM
To: Mark Fox - NOAA Federal
Subject: NWS UPDATE: Sleet / Freezing Drizzle Late Tonight - Monday

Good morning / afternoon,

Round one of precipitation is upon us, this one in the form of rain. There may even be a few thunderstorms in the mix through the afternoon hours. By tonight, the temperatures drop further, and the next wave appears. There may be a few hours this evening with no precipitation ☐ do not be fooled into thinking that the event is over. The main upper level system moves across the area tonight, with the highest potential for frozen precipitation early in the morning hours on Monday. A pdf has been attached in an attempt to clarify locations an impacted expected across all 46 counties in north and central Texas.

BOTTOM LINE:

Parts of north and central Texas will experience a winter storm beginning late tonight/early Monday, with impacts lingering into early Tuesday. Emergency Managers, public safety officials, and transportation officials should be prepared for an extended period of cold temperatures and impacts from a mixture of sleet and freezing rain. The precipitation totals will be as great as those experienced during the December 6-7, 2013 ice event, and we believe temperatures during the precipitation will be colder than it was during the cobblestone ice event. (less thawing and refreezing) Nevertheless, surface temperatures will be sufficiently cold for widespread

areas of ½□-1□ of sleet with pockets of areas of up to 2 inches of sleet and freezing rain to accumulate on many roads and bridge surfaces, forming a slick glaze by Monday morning.

AREAS /TIMING:

Winter weather impacts are likely across most areas of North Texas beginning late tonight and early Monday. The precipitation will end on Monday, but travel impacts will linger into Tuesday morning before improving. The DFW Metroplex remains within the area that has the greatest potential for surface and aviation travel impacts. See the attached graphics for a better explanation of the areas, but in a general sense, areas north of Interstate 20 (including the DFW Metroplex and Ranger Hill) will likely see the heaviest precipitation totals and thus the greatest impacts.

Be prepared for temperatures to remain at or below freezing across a large part of North Texas on Monday. Coupled with a lack of sunshine, this will limit any melting that might otherwise occur. We don't expect temperatures to rise above freezing until late morning Tuesday. Varying slightly by exact location, we are expecting approximately 40 hours at or below freezing during this event. (Around midnight tonight through Tuesday midday)

IMPACTS:

Bridges and Overpasses are expected to become slick and hazardous. Most roadways are expected to be icy as well. In the highest sleet accumulation areas, there could be ruts on the roadways in the sleet.

Given the strong trends toward sleet at the expense of freezing rain, we don't currently expect any widespread power outages. Freezing rain totals may be great enough in a few areas to cause at least spotty power outages across north and central Texas Sunday night and Monday, however. Temperatures and winds will combine for wind chill readings below 10 for much of the day on Monday and into Monday night.

CONFIDENCE AND ALTERNATE SCENARIOS

Our confidence that some areas will receive impacts from sleet and freezing rain is high, now up to an 9 on a scale of 1 to 10. The exact amounts of sleet and freezing rain in given areas are still somewhat uncertain, due the localized nature of the heaviest precipitation. Our current thinking is that up to one half inch of sleet will occur in many areas, coupled with up to one tenth inch of freezing rain. The highest amounts could be as high as 2 inches of sleet. However, if the storm system is able to sustain locally greater amounts of lift, then the precipitation amounts (and impacts) may increase as well.

Look for areas where the air temperature falls to 30 degrees or below. Once this happens, the impacts from the winter precipitation will begin to occur.

Sent: Sunday, February 22, 2015 2:51 PM
To: undisclosed-recipients:
Subject: Winter Weather Advisory Issued for Portions of South Central Texas for Monday

South Central Texas Partners...

...HEADLINE...Winter Weather Advisory in effect on Monday from 3 AM-6 PM for western portions of South Central Texas including the Hill Country and Williamson/Travis Counties...Some travel impacts are possible...

Another Winter Weather Event with a whole lot of ???????? Please monitor the forecast and area temperatures closely the next 24 hrs.

...COUNTIES IN THE ADVISORY...

Williamson, Travis, Burnet, Llano, Gillespie, Blanco, Hays, Kerr, Kendall, Bandera, Real, Edwards, Val Verde

...AREA OF CONCERN...

* Cold Arctic Air - All of South Central Texas.
* Freezing Rain/Drizzle Monday Morning - Mainly along and north of a line from Juno-Kerrville-Burnet on Monday morning.
* Freezing Rain/Drizzle Monday - western Hill Country. Small chances along the I-35 corridor (Hays/Travis/Williamson)
* Freezing Rain Monday Night/Tuesday Morning -Low chances for northern and eastern areas. .

...IMPACTS...

* Less than .05 of ice accumulation expected. Accumulations only expected on exposed surfaces, bridges and overpasses. Worse accumulations will be in the northern Hill Country where temperatures may dip below 30 degrees.
* Travel impacts should be minor as ground temperatures should remain quite warm initially. Exposed surfaces, some bridges and overpasses may see minor icing, and slippery walkways are anticipated. Rainfall is expected to be light so any accumulations should be a gradual process.

...TIMING...

* Arctic air will arrive Tonight and remain in South Central Texas through Tuesday.
* Chance of freezing precipitation will begin around daybreak Monday morning over the far western Hill Country with the threat spreading across the northern sections of South Central Texas by mid to late afternoon Monday. Threat could extend into Monday Night.

...CONFIDENCE... Arctic Air (Moderate to High)...Frozen Precipitation amounts and area (Low)

...DISCUSSION...

Cold air will slowly move down into the region overnight into Monday. Temperatures will be much colder on Monday as an arctic air mass takes hold of South Central Texas and temperatures fall throughout the day. The northern half of area will see early afternoon temperatures in the lower to middle 30s. Across the northern Hill Country and areas along I-35 north of San Marcos, mid to late afternoon temperatures may drop to the freezing mark.

Some weak disturbances coming in from the west will help develop some light rain and drizzle through the day on Monday possibly lasting through Monday night into Tuesday. This combination of arctic air and precipitation may allow for some light icing on exposed surfaces, bridges, overpasses, cars, etc. A Winter Weather Advisory has been issued for the western most areas of South Central Texas including the Hill Country and Travis/Williamson Counties. The advisory is in effect from 3 AM-6 PM on Monday. See the attached graphic for the counties under the advisory.

We don't see any threat of icing in the Austin area for the Monday Morning Commute. Any threat of light icing early Monday morning will be over the far western Hill Country where temperatures are expected to be coldest during the predawn hours...near the freezing mark. The threat of light icing on bridges and overpasses will increase across the Advisory Area during the day on Monday as temperatures drop to near the freezing mark by late afternoon. Since we are expecting temperatures to be somewhere in the 30-35 degree range in the advisory area, the warm ground temperatures should keep the icing to a minimum, mainly exposed surfaces and bridges. If the temperatures drop below forecast numbers, the impact from ice would likely increase.

By Monday night, the freezing line will drop a bit farther south and east as colder air continues to filter into the area. Rain chances will be lowering however as the main area of moisture and rains moves to the east. If there is a bit of lingering rain activity around Monday night, the colder temperatures would still allow for some light ice accumulation. If that would occur, the advisory would likely have to be extended into Monday Night. Residents of South Central Texas need to monitor the forecast closely over the next 24 hours as the weather conditions can change very quickly.

We will supply another update on Monday before Noon.

You can see the latest forecasts and watches/warnings/advisories by going to the Austin-San Antonio National Weather Service website at www.weather.gov <http://www.weather.gov/austin> /ewx

From: Jon Zeitler - NOAA Federal [mailto:jon.zeitler@...]
Sent: Monday, February 23, 2015 3:06 PM
To: undisclosed-recipients:
Subject: Winter Weather Update Issued at 300 pm Monday Feb. 23rd

South Central Texas Partners...

...HEADLINE...The Winter Weather Advisory remains in effect through 6 PM for the northwestern half of South Central Texas, especially the Hill Country and Williamson/Travis Counties. Minor travel impacts are possible.

...COUNTIES IN THE ADVISORY...

Williamson, Travis, Burnet, Llano, Gillespie, Blanco, Hays, Kerr, Kendall, Bandera, Real, Edwards, Val Verde

...AREA OF CONCERN...

· Cold Arctic Air - All of South Central Texas.

· Freezing Rain/Drizzle - mainly Hill Country, but also scattered spots on the I-35 corridor (Hays/Travis/Williamson counties)

· Freezing Rain/Drizzle Tonight/early Tuesday Morning - Low chances for northern and areas east of metro Austin. .

...IMPACTS...

· Less than .05 of ice accumulation expected. Accumulations only expected on exposed surfaces, bridges and overpasses. Larger accumulations may occur in the Hill Country where temperatures are below 30 degrees.

· Travel impacts should be minor as ground temperatures were warm initially. Exposed surfaces, bridges/overpasses, and lower traffic surfaces such as sidewalks may see minor icing. Rainfall is expected to be light so accumulations should be a gradual process.

...TIMING...

· Arctic air will remain in place through Tuesday.

· A mix of light rain, or freezing rain/drizzle is possible in the Hill Country and northern sections of South Central Texas through this afternoon. The bulk of the precipitation should end by sunset, but patchy, light freezing drizzle or sleet are possible overnight for the area that is east of I-35 AND north of I-10 (see third graphic below).

...CONFIDENCE...

Arctic air (High)...Frozen precipitation amounts and area (Low)

...DISCUSSION...

The forecast remains on track from our previous updates. The Arctic air moved in last night, and the freezing line now extends roughly from Taylor to San Marcos to Helotes to Bandera to just north of Del Rio. We continue to receive reports of light freezing drizzle, but accumulations are very spotty and light so far, with minor or no traffic impacts.

We expect this spotty and light precipitation to continue through sunset as an upper level disturbance moves east of the area. The precipitation should end for most locations by sunset, although patchy, light freezing drizzle is possible for the area east of I-35 AND north of I-10. The overnight precipitation is not expected to have only minor or no travel impacts.

In summary, we continue to expect some light and patchy icing in the Advisory areas through sunset. There may be travel impacts, most likely slippery spots, especially on bridges, flyovers, and any other surface the cold air can get under (e.g., a picnic table). The afternoon commute will be impacted in Metro Austin and locations in the Hill Country, but primarily just slower driving speeds.

The latest forecasts and watches/warnings/advisories are at our Austin-San Antonio National Weather Service website at www.weather.gov <http://www.weather.gov/austin> /ewx

-Jon Zeitler

To: undisclosed-recipients:
Subject: NWS Fort Worth/Dallas Winter Weather Update Through Mid-week

Good afternoon,

The ongoing winter weather event will continue to slowly wind down this evening and tonight. However, the forecast for Tuesday night and Wednesday morning now features a second episode of winter weather, with a potential for accumulating snow across parts of north Texas.

A Winter Weather Advisory will remain in effect through 6 AM Tuesday across our southern counties as light accumulations of freezing rain or sleet could cause travel problems. However, we are planning on letting the Winter Storm Warning across the north expire on schedule at 6 PM this evening since any additional winter precipitation tonight is expected to be very light.

With temperatures remaining at or below freezing in many areas through tonight, there will be a threat of slick roadways across nearly all of north Texas early Tuesday. Improving conditions are forecast by late morning as temperatures gradually rise above freezing in all areas.

This message and the attached graphics will focus on the potential for another winter weather event Tuesday night into Wednesday morning.

BOTTOM LINE:

Most areas of additional precipitation across north and central Texas through tonight will be light, but the existing icy roadways in some areas will persist into Tuesday morning. With temperatures rising above freezing in most areas by late morning, road conditions should improve as the day progresses.

The forecast for Tuesday night and Wednesday morning has changed significantly since this morning, with a major weather system now forecast to move quickly across north Texas

Wednesday morning. Accumulating snows of 1 to 3 inches are possible across parts of north Texas, with very isolated higher amounts of 4 to 6 inches possible. However, there is considerable uncertainty with regard to the track of the weather system, and the zones where the best ingredients for snow will converge. The exact track and strength of the system will dictate which areas receive accumulating snows - and which areas receive little or no snow. Later forecasts will be able to refine the locations that have the greatest potential for accumulating snow.

AREAS /TIMING:

The snow potential Tuesday night into Wednesday morning will extend from around midnight to noon. A band of snow will move into western areas by midnight Tuesday night, develop eastward toward the DFW metroplex by 3 am, and then end in the east before midday. The most likely area to see some accumulating snow will be those areas north of a Comanche to Hillsboro to Athens line. Within this large area, there will be a smaller, relatively narrow band where higher accumulations may occur.

IMPACTS:

The snow that occurs should be relatively wet, and come down in bursts. Snow covered bridges, overpasses, and primary roadways would be the primary impacts during this event. The good news is that we expect temperatures to rise above freezing in all areas by late Wednesday morning, so the worst impacts from the snow should be short lived. In the worst case scenario, however, some isolated areas could experience power outages where heavy, wet snow collects on branches and on lines.

CONFIDENCE AND ALTERNATE SCENARIOS

For the Tuesday night and Wednesday morning system, our confidence is low-moderate on exactly which areas will receive accumulating snow, with a confidence factor of 4 on a scale of 1 to 10. We do have confidence that the precipitation type will be either snow or rain, or a mixture of rain and snow. There is no real threat of sleet or freezing rain Tuesday night or Wednesday. One alternate scenario is that the upper level system will be stronger than forecast, leading to a more widespread area of heavier snow. However, another, equally possible scenario brings a weaker, slightly warmer system over us, producing less accumulating snow and/or more of a rain and snow mix in some areas.

Unlike the sleet event that just occurred, this upcoming snow event represents a very fluid forecast situation, and confidence in all aspects of the event is not as great. Impacts, however, could be of comparable magnitude, at least in some areas. Please stay focused on upcoming forecasts from now through early Wednesday morning as this event unfolds.

More of the same old same.

Sorry about the delay. been trying to get smart about a new smart TV.

I have upgraded my internet service, my camera, my TV, my Droid pad, and my DSS service, each of which has a basic learning curve and a month of playing around to get them working. I am so obsolete. I just got my thousand mile check up and should be good for another thousand so I gotta learn this stuff. I need some great-grand children to help me.

Subject: NWS Fort Worth/Dallas Winter Weather Update

Good afternoon,

Weak sunshine and slowly rising temperatures will continue to erase the effects of Monday's winter weather event. However, we are expecting a snow event late tonight into Wednesday morning which may bring additional travel impacts to parts of north and central Texas.

Yet another winter weather episode is possible Friday or Saturday, but right now the impacts from that system are not expected to be significant. This message and the attached graphics focus on the details of the winter weather forecast for tonight into Wednesday morning.

BOTTOM LINE:

The system that will affect north and central Texas tonight and early Wednesday is currently over Arizona. This system is strong and fast moving, and its exact track will dictate which areas receive the most snowfall. Accumulating wet snow of 1 inch - ranging up to 3 inches - are possible across parts of north Texas with this event. There is a small chance that a

few locations could even see more snow than this, but this is considered a worst case scenario.

With temperatures around 29-33 degrees when the snow is falling, some roadways and especially bridges and overpasses could become snow covered between 4 AM and 10 AM. When the snow ends, temperatures will rebound rapidly into the mid and upper 30s by late morning and into the 40s by Wednesday afternoon, which will greatly limit the probability and duration of slick roadways. There is still uncertainty with regard to which areas of north Texas are likely to see only an inch or so of snow and which areas 3 or more inches. While confidence in the potential for some snow is moderate, our confidence in amounts and impacts is LOW - unlike Monday's sleet event. We may not have a total handle on this event until early Wednesday morning.

AREAS /TIMING:

The snow potential for tonight into Wednesday morning will extend from around midnight to noon. A band of snow will move into western areas by midnight Tuesday night, develop eastward toward the I-35 corridor including the DFW Metroplex by 3 am, and then end in the east before midday. The most likely area to see some accumulating snow will be those areas along and north of a line from Goldthwaite to Waco to Palestine. Somewhere within this larger area, there may be a smaller, relatively narrow band where higher accumulations may occur.

IMPACTS:

The snow that occurs should be relatively wet, and come down in bursts. Slushy snow covered bridges, overpasses, and primary roadways would be the primary impacts during this event. In very isolated areas that receive more than 2 or 3 inches of snow, the weight of that snow could break tree limbs and lead to isolated power outages. The good news is that we expect temperatures to rise above freezing in all areas by mid morning, so the impacts from the snow should be short lived. The chances for any freezing rain or sleet with this particular system are very low.

CONFIDENCE AND ALTERNATE SCENARIOS

Our overall confidence on this snow event is 6 on a scale of 1 to 10. Our confidence is moderate that it will snow and some areas will receive 1 to 3 inches of accumulation. However, our confidence is still low on determining which areas will receive the greatest snow totals. We do have confidence that the precipitation type will be probably be snow, or a mixture of rain and snow. One alternate scenario is that the upper level system will be weaker and slightly warmer over us, producing less accumulating snow and/or more of a rain/snow mix in some areas.

Unlike the sleet event that occurred on Monday, the snow event that develops late tonight is more of a forecast challenge. The areas that have the greatest potential for the highest snow totals may not become apparent until the system moves into north Texas and the precipitation begins to develop

later tonight. Stay tuned to the forecast through tonight for any last minute changes that may be needed.

Subject: NWS Fort Worth Dallas Winter Weather Update: Impacts Possible Fri/Sat

Good afternoon everyone,

We've navigated the first two winter weather events of this very busy week, and tonight should offer us a chilly yet dry reprieve. Unfortunately, we remain in a cold, unsettled pattern, and as a result - more potential winter weather awaits us Thursday, and again from late Friday through Saturday afternoon. Above anything else, it will remain cold through Saturday, with temperatures remaining in the 30s throughout.

With additional cold air, lift and moisture in place over the region, there will be a small chance of very light snow Thursday afternoon. No appreciable impacts are expected from this snow, however. While we're still a couple of days away, the system Friday afternoon through Saturday afternoon looks a bit more concerning. Our confidence is not yet strong, but it does that appear that we will have a chance for snow across much of North Texas Friday and Friday night, transitioning to a freezing drizzle/rain pattern Saturday morning. Amounts are still questionable, but temperatures DO appear to be cold enough to cause some potential impacts - both from any snow we receive Friday, and from any icing we encounter Saturday morning.

BOTTOM LINE: We have a small chance of snow Thursday, but impacts are not expected. Another winter precipitation episode is possible for North and Central Texas from Friday afternoon through Saturday afternoon. It will probably start out as light snow, and transition to freezing drizzle or light rain. Our confidence in impacts is low to moderate at this time, but this will be one to watch closely as we get later in the week. All of our media, government, EM and other emergency response partners need to watch

the forecast closely, and be prepared for additional response activities Friday and Saturday.

We will issue another e-mail summary Thursday - hopefully by early afternoon. In the meantime, please don't hesitate to call us or e-mail us if you have a specific need.

Tom

Subject: NWS Dallas/Fort Worth Update: Winter Weather Impacts Thursday and
Friday

Good afternoon everyone,

We continue to experience light snow across our western counties this
afternoon, and some accumulations and impacts have occurred in these areas.
A bit later this afternoon, we'll be putting out a quick update on what we
expect in these counties for later today and tonight. Otherwise, the
majority of this briefing will focus on our next round of winter
precipitation - which will occur Friday and Saturday.

BOTTOM LINE:

North Texas is going to encounter another round of snow Friday,
transitioning to freezing drizzle (or light freezing rain) late Friday night
and continuing into the morning hours Saturday. By around Noon Saturday, we
think the precipitation will change over to intermittent light rain in most
areas. While we don't expect a significant winter storm, there likely will
be travel impacts - particularly from the Metroplex north and west.

The forecast for this upcoming event is proving to be a challenging one.
Our overall confidence is only moderate, and in particular we have quite a
bit of uncertainty about how the roads are going to respond to precipitation
during the early to mid afternoon hours. Unfortunately, this will be
another event where key decisions may not be easily facilitated until just
before the precipitation occurs.

LOCATIONS/TIMING/AMOUNTS:

Snow will begin in our western counties after daybreak, and spread steadily eastward through the morning Friday. By 10 am - Noon, snow should reach the I-35 corridor, including the Metroplex, then impact the eastern counties by early afternoon. Snow will continue intermittently through the afternoon hours - sometimes falling heavily in narrow bands. Most areas will see 1" or less of snow. However, counties west of I-35 and north of I-20 may see some amounts of 2 to 4".

With temperatures hovering in the upper 20s across the area Friday, we believe the snow will at least accumulate on bridges and elevated surfaces during the day Friday. Some snow may also stick to roads. We are uncertain as to how this will impact the roads, exactly, but we do think there will be some slick conditions across a good part of N Texas - including the Metroplex.

By late evening, we think most of the snow will taper off and transition to light drizzle, or light freezing rain. This pattern will persist into the morning hours Saturday, as temperatures remain in the mid to upper 20s. Accumulation amounts should be light - less than 0.10" in nearly all areas. However, even light amounts of glazing at these temperatures can yield slick conditions - at least on bridge decks. By midday, temperatures in most locations will rise to around - or above - freezing, and we should transition to very light drizzle in the afternoon. There will be an ongoing chance of rain later Saturday night and Sunday, but no additional icing is expected during the latter half of the weekend.

CONFIDENCE/ALTERNATE SCENARIOS:

The primary alternative scenario is that the lower atmosphere remains too dry to support the amount of snow we expect. If this happens, we won't see quite as much snowfall accumulation as expected. On the freezing drizzle side of the house, it's possible we could see a little more precipitation than we expect early Saturday morning. This is not considered a very plausible scenario, however.

To reiterate, our confidence in how the road conditions are going to respond to tomorrow's snowfall is not high. While we DO believe there will be some impacts, right now we don't think they'll be extensive. This will be something to keep a very close eye on later today through Friday, understanding that many entities will have to make decisions on activities that are scheduled for both Friday afternoon and Saturday morning.

Please don't hesitate to call or e-mail us if you have specific questions or concerns.

Thanks,

Tom

Rogers; Villegas, Lisa; whoux@kcentv.com; Williams, Paul Subject: NWS Dallas/Fort Worth Update: Winter Weather Impacts Thursday and Friday Good afternoon everyone, We continue to experience light snow across our western counties this afternoon, and some accumulations and impacts have occurred in these areas. A bit later this afternoon, we'll be putting out a quick update on what we expect in these counties for later today and tonight. Otherwise, the majority of this briefing will focus on our next round of winter precipitation - which will occur Friday and Saturday. BOTTOM LINE: North Texas is going to encounter another round of snow Friday, transitioning to freezing drizzle (or light freezing rain) late Friday night and continuing into the morning hours Saturday. By around Noon Saturday, we think the precipitation will change over to intermittent light rain in most areas. While we don't expect a significant winter storm, there likely will be travel impacts - particularly from the Metroplex north and west. The forecast for this upcoming event is proving to be a challenging one. Our overall confidence is only moderate, and in particular we have quite a bit of uncertainty about how the roads are going to respond to precipitation during the early to mid afternoon hours. Unfortunately, this will be another event where key decisions may not be easily facilitated until just before the precipitation occurs.
LOCATIONS/TIMING/AMOUNTS: Snow will begin in our western counties after daybreak, and spread steadily eastward through the morning Friday. By 10 am - Noon, snow should reach the I-35 corridor, including the Metroplex, then impact the eastern counties by early afternoon. Snow will continue intermittently through the afternoon hours - sometimes falling heavily in narrow bands. Most areas will see 1" or less of snow. However, counties west of I-35 and north of I-20 may see some amounts of 2 to 4". With temperatures hovering in the upper 20s across the area Friday, we believe the snow will at least accumulate on bridges and elevated surfaces during the day Friday. Some snow may also stick to roads. We are uncertain as to how this will impact the roads, exactly, but we do think there will be some slick conditions across a good part of N Texas - including the Metroplex. By late evening, we think most of the snow will taper off and transition to light drizzle, or light freezing rain. This pattern will persist into the morning hours Saturday, as temperatures remain in the mid to upper 20s. Accumulation amounts should be light - less than 0.10" in nearly all areas. However, even light amounts of glazing at these temperatures can yield slick conditions - at least on bridge decks. By midday, temperatures in most locations will rise to around - or above - freezing, and we should transition to very light drizzle in the afternoon. There will be an ongoing chance of rain later Saturday night and Sunday, but no additional icing is expected during the latter half of the weekend. CONFIDENCE/ALTERNATE SCENARIOS: The primary alternative scenario is that the lower atmosphere remains too dry to support the amount of snow we expect. If this happens, we won't see quite as much snowfall accumulation as expected. On the freezing drizzle side of the house, it's possible we could see a little more precipitation than we expect early Saturday morning. This is not considered a very plausible scenario, however. To reiterate, our confidence in how the road conditions are going to respond to tomorrow's snowfall is not high. While we DO believe there will be some impacts, right now we don't think they'll be extensive. This will be something to keep a very close eye on later today through Friday, understanding that many entities will have to make decisions on activities that are scheduled for both Friday afternoon and Saturday morning. Please don't hesitate to call or e-mail us if you have specific questions or concerns. Subject: 9 AM NWS Fort Worth/Dallas Winter Update

Good morning,

Snow is already affecting N Texas this morning, as we discussed yesterday. Here's a very quick update on our thinking:

OVERALL SCENARIO:

Snow will continue to overspread most of North and Central Texas through the morning hours, and continue through the day. There will be accumulations in most areas - including on many roads. The snow will become lighter and more intermittent as move into the late afternoon/early evening hours. There may be a few hours this evening and overnight where we see no precipitation. There WILL be slick spots and travel impacts today across N Texas, but the exact behavior of the roads (due to enhanced daytime traffic) cannot be predicted very well.

At some point after 6 PM, our temperature profile will warm up, and the precipitation type will chance to light freezing drizzle. This drizzle will likely continue intermittently through the morning hours Saturday. With temperatures remaining just below freezing, it will likely freeze on contact with elevated surfaces, and probably some road surfaces too. Temperatures by midday should climb above freezing, diminishing any further icing impacts.

SPECIFICS AS WE KNOW THEM NOW:

Amounts: 2-4 inches in our NW counties...mainly N and W of Metroplex. 1-2 inches in the greater Metroplex area. One inch or less to the S and E of

the Greater Metroplex, including Waco and Killeen. Very light glazing amounts of freezing drizzle Saturday morning.

Timing: Bulk of the snow will occur prior to 2 pm in most areas. Intermittent snow showers will linger into 8 pm, however...ending from west to east. Freezing drizzle will begin after midnight, and continue through late morning hours Saturday, before temperatures rise above freezing by noon.

NEXT E-MAIL UPDATE: 12 pm CST

Subject: Briefing for Upcoming Winter Weather on Today/Saturday

Good Morning South-Central Texas Partners,

Headline:

Another round of wintry mixed precipitation on the way from this morning through 10 am Saturday for higher elevations in the Hill Country, and the far western portion of Williamson County.

Area of Concern:

The primary area will be the Hill Country, roughly from Burnet to Fredericksburg to Kerrville to Rocksprings. Another area of concern is is the far western end of Williamson County, from Florence down to Liberty Hill. Metro Austin, the I-35 corridor, and Metro San Antonio are now completely out of the winter weather threat.

Threats & Impacts:

Expected Accumulations: We expect very light amounts -- 1/4 inch or less of snow in the Hill Country, accompanied by only a few hundredths of sleet or freezing rain/drizzle in that area, and in far western Williamson County.

Impacts: The primary impacts are expected to be patchy slippery spots, primarily on bridges, overpasses, and other elevated surfaces (e.g., picnic tables).

Timing and Overview:

Moist Gulf air will continue to lift over cold air near the ground to produce the wintry mix of precipitation. As with the other events this winter, we expect precipitation amounts to be light, and generally be more of a travel nuisance than any threat to safety. All of the precipitation should end by 10 am on Saturday, and temperatures will warm above freezing then. Please see the graphics below.

Confidence:

High for the temperatures being cold, High for the precipitation mix and amounts.

Additional Information Resources:

Subject: 330 PM NWS Fort Worth/Dallas Winter Update

Good afternoon,

Here's the latest update:

OVERALL SCENARIO:

Light snow will continue over most of North Texas through 7 pm, then begin to diminish significantly in areal coverage during the evening. Some very light sleet and freezing drizzle may also start to mix in with the snow as we go into the early evening. Over parts of Central Texas, mainly south of a Corsicana to Goldthwaite line, we'll see a mixture of snow, freezing drizzle and liquid drizzle from now through 10 pm.

We continue to see bands of enhanced snowfall redeveloping from Wise and northern Tarrant County, extending northeastward through Denton, Cooke and Grayson Counties. Visibilities and particularly slick conditions may be expected where these bands set up. Isolated heavier snow showers will also stream across Collin and Hunt Counties. These heavier areas should diminish in coverage as we go forward in time, but will persist through 6 pm. Overall, travel conditions in the Metroplex will not necessarily improve greatly through the afternoon rush hour, but they are unlikely to deteriorate further. Areas W through N of Denton, however, may briefly see worsening conditions as the bands set up in these areas.

SPECIFICS AS WE KNOW THEM NOW:

This evening/overnight

At some point between 8 pm and 10 pm, our temperature profile over North Texas will warm up, and the precipitation type will chance to very light freezing drizzle. This drizzle will likely continue intermittently through midday Saturday. With temperatures gradually inching upward overnight, but remaining below freezing, we expect the combination of freezing drizzle and snow on the ground to create slick conditions throughout North Texas.

Saturday/Sunday

Temperatures at daybreak Saturday morning will start off in the 27-30 degree range in many areas of North Texas, and slowly climb to around freezing by noon Saturday. Farther south toward Waco, Temple and Killeen, temperatures will rise above freezing sooner - perhaps as early as 9 am. While gradual improvement in road conditions may occur Saturday morning, especially in the Metroplex area, appreciable improvements are not expected until Saturday afternoon when readings rise into the middle 30s. Again, it should be stressed that any snow on the ground this afternoon will remain mostly intact through at least the morning hours Saturday.

A chance of very light rain and drizzle will continue for most areas from Saturday afternoon through Sunday, but amounts will be very light. Temperatures will stay above freezing from Saturday afternoon through Sunday morning, allowing slow melting on streets to continue. By Sunday afternoon, readings should rise well into the 40s - and even lower 50s.

Amounts: Additional amounts of up to 1 inch in a few of the heavier bands N and W of Metroplex. Additional amounts of a dusting to 1/4" in the greater Metroplex area. Small amounts of snow, coupled with freezing drizzle, to the S and E of the Greater Metroplex, including Waco and Killeen. Very light glazing amounts of freezing drizzle possible through Saturday morning.

NEXT E-MAIL UPDATE: 9 pm CST

Thanks,

Tom

Subject: Winter Weather Update - 815 PM

Good Afternoon South-Central Texas Partners,

Headline:

A Winter Weather Advisory is in effect until 10 am Saturday for the entire Hill country, I-35 corridor, Metro Austin, and Metro San Antonio. Numerous Reports of Icing across Williamson, Burnet, and Gillispie County.

Area of Concern:

The primary area will be roughly from Taylor in eastern Williamson County to the southwest border of Bexar County, and along and west of U.S. 90 from San Antonio to Del Rio. This does include All of Metro Austin and Metro northern San Antonio.

Threats & Impacts:

Expected Accumulations: We expect light amounts of 1/10 inch or less freezing drizzle in the advisory area.

Impacts: The primary impacts are expected to be slippery spots, primarily on bridges, overpasses, less traveled roads, and other elevated surfaces (e.g., backyard decks).

Timing and Overview:

Freezing drizzle is on the increase at the present time and numerous reports of icing mainly on bridges and overpasses have come into the office. In the attached image, most of the moderate impacts have been in the yellow shaded

region. Locations in the pink area can quickly see impacts as the night progresses. The most significant impacts will be where temperatures have dropped below 30 degrees. Precipitation is light but it only takes a little to cause moderate impacts of ice. The freezing drizzle should continue for most of the night with a nearly steady temperature. Temperatures should warm above freezing around 9-10 AM Saturday morning.

Confidence:

High for the temperatures being cold, High for freezing precipitation and amounts.

Sent: Monday, March 02, 2015 3:17 PM
To: undisclosed-recipients:
Subject: Another chance for winter type precipitation Wednesday Evening through Thursday AM.

Good afternoon South-Central Texas Partners,

Headline:

...More chances of frozen precipitation Wednesday evening into Thursday Morning...

Area of Concern:

Cold Arctic Air - All of South Central Texas

Frozen Precipitation - Mainly the Hill Country, areas northwest of San Antonio, and northern parts of I-35 corridor including the greater Austin metro area (Travis and Williamson Counties).

Threats & Impacts:

Ice Accumulations: There is a high likelihood that areas of the Hill Country will see ice accumulations. It is too early to tell exactly how much. As in the previous winter events the past several weeks, areas farther east including the I-35 corridor will have a threat for icing but temperatures may not be cold enough to support widespread ice development outside of bridges and overpasses. Stay tuned, that could change.

Impacts: Mainly travel impacts expected at this time. Bridge/overpasses closures, some ice on less traveled roads. Numerous traffic accidents. At this time we are not expecting widespread power outages.

Timing and Overview:

- 6 PM Wednesday through Noon Thursday.

An Arctic airmass will arrive on Wednesday Afternoon in the form of a strong cold front. Some areas in the Hill Country may see freezing temperatures by mid day Wednesday. Other areas of South Central Texas including the northern sections of the I-35 corridor near Austin will see the temperatures drop to near freezing by late evening Wednesday. An upper level storm system off to the west will create high precipitation chances Wednesday into the first part of Thursday. We even have chances of thunderstorms in the forecast on Wednesday letting you know we are going to see some better lift with this system compared to previous systems.

Several questions remain...how much precipitation, and where will it be cold enough for frozen precipitation? As the front approaches, we will hopefully be able to answer some of these questions in more detail over the next 48 hours. As in past events this year, many areas will likely just get very cold rain, while other areas, mainly to the west and higher elevations along the escarpment and Hill Country, temperatures will be cold enough to support ice formation especially on exposed surfaces like bridges and overpasses. At this point we just don't know where those lines will set up.

Watch the forecast closely over the next few days...there will likely be adjustments to the above forecast information. There is a high likelihood that portions of the area will be under some sort of winter weather advisory/watch/warning during this 6PM Wed - Noon Thu time frame.

Confidence:

Arctic Air - High

Frozen Precipitation Amounts/Area - Moderate

Subject: NWS Fort Worth/Dallas Winter Weather Update for Wednesday

Good afternoon everyone,

Unfortunately, another winter precipitation event will be impacting most of North and Central Texas Wednesday through Thursday morning. Right now, sleet appears to be the main precipitation type, though some freezing rain and/or light snow may enter the picture in a few spots. While we're increasingly confident that some frozen precipitation - and travel impacts - will occur across our area, we're only moderately confident about amounts and expected road conditions. This is due the fact that there will be a race underway between the arrival of the true arctic, sub-freezing air, and the cutoff line for precipitation that'll be ongoing from N to S across the area Wednesday night. Timing will be critical with this upcoming event.

BOTTOM LINE: Most of North and Central Texas will experience frozen precipitation (mainly sleet) Wednesday afternoon/Wednesday night, with some of it lingering in Central Texas Thursday morning. Across North Texas, we don't believe we'll be facing as many impacts as we experienced with Friday's event. Nevertheless, some sleet will accumulate with temperatures in the upper 20s, and that'll likely produce slick conditions on elevated surfaces - and some roads - by late afternoon/evening Wednesday. Right now, we don't expect any significant power outages from DFW northward.

We have somewhat more confidence that Central Texas (especially along and S of a Lampasas to Waco to Athens line) may experience impacts due to higher amounts of moisture and lift. In these areas, a greater proportion of the winter precipitation may take the form of freezing rain, in addition to sleet. We thus have more confidence that slick conditions - and possibly some ice accumulations on power lines - will develop in these areas by Wednesday evening/night. Some of these areas in Central Texas may experience their most significant winter weather events of the season.

A significant amount of uncertainty still exists with this forecast. However, all of our emergency management, media, public safety and transportation partners should be watching this system closely, and considering preparations for another round of travel impacts during the Wednesday and Thursday timeframe.

TIMING: A transition from rain to sleet will occur in our northernmost counties between Noon and 3 pm, with slick roads/bridges likely from early afternoon onward. In the greater DFW area and I-20 corridor, the rain to sleet transition will take place between 2 pm and 4 pm, with some slick conditions possibly developing (at least on bridges) by late afternoon. South of a Lampasas-Waco-Athens line, the transition from rain to freezing rain and sleet should take place between 5 pm and 8 pm, with sleet continuing intermittently all night. Slick conditions in these areas should gradually develop and worsen after 6 pm, through the night.

AMOUNTS: Our estimates right now include up to 1/4" of sleet from I-20 northward (including DFW), with anywhere from 1/2 to 1" of sleet possible south of I-20. Some accumulations of freezing rain will also occur. These amounts are subject to change.

CONFIDENCE/ALTERNATE SCENARIOS: Our overall confidence in this forecast is moderate. Our main concerns are: a) the timing of the sub-freezing air (and <30 deg air) into the different parts of our area, and b) how much precipitation will continue to fall in these areas once the cold air is in place. The forecast should start to come into better focus by tomorrow afternoon, and certainly Wednesday morning, once the cold air nears Texas.

One alternative scenario would have the colder air arrive faster and deeper than previously forecast, with just as much - or more moisture. If this happens, sleet and snow amounts will correspondingly increase, and travel conditions will deteriorate significantly across all of N and C Texas. Another scenario would maintain the current timing on the arrival of the cold air, but decrease the amount of precipitation that we experience. Impacts would thus be diminished from what is forecast. Right now, both scenarios are unlikely. However, our partners should be prepared for the first alternative, which could conceivably result in greater icing impacts across N/C Texas.

We'll obviously be assessing all available data over the next 2 days, and refining the forecast accordingly. We'll issue another heads up e-mail on Tuesday. In the meantime, please don't hesitate to contact us if you have any immediate needs or questions.

Thanks,

Tom Bradshaw/Mark Fox

Subject: Wintry Mix Possible Wednesday Evening through Noon Thursday

Good Morning South-Central Texas Partners,

Headline:

...Another round of frozen precipitation is possible Wednesday evening through Thursday morning...

Area of Concern:

Cold Arctic Air - All of South Central Texas

Frozen Precipitation - Mainly the Hill Country, areas northwest of San Antonio, and northern parts of I-35 corridor including the greater Austin metro area (Travis and Williamson Counties).

Threats & Impacts:

Ice Accumulations: There is a high likelihood that areas of the Hill Country will see ice accumulations. It is too early to tell exactly how much. As in the previous winter events the past several weeks, areas farther east including the I-35 corridor will have a threat for icing but temperatures may not be cold enough to support widespread ice development outside of bridges and overpasses. Stay tuned, that could change.

Impacts: Mainly travel impacts expected at this time. Bridge/overpasses closures, some ice on less traveled roads. Numerous traffic accidents. At this time we are not expecting widespread power outages.

Timing and Overview:

- 6 PM Wednesday through Noon Thursday.

The next front will arrive in South Central Texas Wednesday Afternoon with an arctic air mass behind it. Temperatures will fall behind the front with the Hill Country reaching freezing around 9 pm Wednesday. Northern Portions of the I-35 corridor will fall below freezing shortly after midnight...this includes the Austin metro area. An upper level storm system will create high precipitation chances Wednesday morning through Thursday morning. Due to the upper level winds we will get more lift with this weather system than previous systems, so some scattered thunderstorms will be possible during the day Wednesday before the front arrives.

Based on our current forecast a Sleet and Freezing Rain mix will begin across the Hill Country Wednesday night stretching from a Del Rio to San Antonio to Giddings line by midnight. This will then transition over to a sleet and snow mix by Thursday morning for areas north of Highway 90. As in past events the best chance for ice accumulation and impacts will be in the Hill Country and along the northern I-35 corridor where temperatures will be coldest. Temperatures are expected to warm above freezing by noon on Thursday and rain chances begin to taper off Thursday afternoon.

The question of just how much precipitation will fall, the exact type of precipitation, and just how far south the freezing line will get, are all still questions that are being fine tuned with each forecast package. As in past events this year, far southern and eastern areas will likely just see cold rain, western and northern areas (higher terrain) will probably get some ice, and areas in the middle (I-35 from San Antonio to Austin) will be stuck in the middle and could go either way. In cases like this, many times I-35 is literally a dividing line...colder air and ice chances in the hills, and cold rain east of I-35. Where it is forecast to be cold enough...such as the Hill Country, we can expect some ice formation especially on exposed surfaces like bridges and overpasses.

Watch the forecast closely over the next few days...there will likely be adjustments to the above forecast information. There is a high likelihood that portions of the area will be under some sort of winter weather advisory/watch/warning during this Wed Evening - NoonThu time frame.

Confidence:

Arctic Air - High

Frozen Precipitation Amounts/Area - Moderate

Subject: NWS Fort Worth/Dallas Winter Weather Update for Wednesday

Good afternoon everyone,

Here's our latest thinking on the winter weather event that will impact North and Central Texas Wednesday/Thursday:

Rainfall will begin to overspread most of the area later tonight, and continue everywhere on Wednesday. Of concern, a strong cold front will surge into North Texas early Wednesday morning and sweep through all of our forecast area by midday. As the cold air deepens across North Texas during the afternoon and evening, we'll see a north to south transition from rain, to either freezing rain or sleet, perhaps ending with light snow. We still believe that sleet will be the predominant frozen precipitation type with this event, though freezing rain will also play a role. All the winter precipitation should taper off and end from NW to SE by Thursday morning.

BOTTOM LINE: Overall, we're now confident that frozen precipitation - and varying degrees of travel impact - will occur across many parts of North and Central Texas through Thursday. For most of North and Central Texas, we don't think the accumulations will be sufficient to cripple travel. However, many bridges and overpasses will be affected, and where ice intersects the evening rush hours, travel impacts will be greatly magnified. This may include parts of the DFW area.

In addition, this system looks "energetic", in the sense that localized forcing and instability will likely produce one or more bands where enhanced sleet (or even freezing rain) will occur. This will occur Wednesday evening. Unfortunately, pinning down the exact location of these enhanced

areas is still difficult at this point. Where the bands do set up, however, travel will be much worse.

All of our emergency management, media, public safety and transportation partners will need to keep watching this system closely, and make preparations for another round of travel impacts during the Wednesday and Thursday timeframe.

TIMING: A transition from rain to sleet will occur in our northwestern counties between Noon and 3 pm, with slick roads/bridges likely from that period onward. In the greater DFW area and I-20 corridor, the initial rain to sleet transition will take place between 3 pm and 6 pm, with some slick conditions possibly developing (at least on bridges/overpasses) during the afternoon/evening rush hours (especially on the north sides of the Metroplex). NOTE: Some freezing rain may also occur during these transition times as well.

South of Interstate 20, the transition from rain to sleet and freezing rain should take place between 6 pm and 10 pm, with sleet continuing intermittently all night. Slick conditions in these areas should gradually develop and worsen after 6 pm, through the night.

Once the initial transition occurs, we expect a second period of enhanced sleet to develop across North Texas during the evening hours (6 pm - Mid). This will result in one or more bands with heavier precipitation - and greater travel impacts.

For Thursday morning, we can expect temperatures in many areas to be as much as several degrees below freezing. As a result, any sleet/ice that's formed overnight will remain in place during the morning hours. We do expect temperatures will rise above freezing in most areas by Thursday afternoon, but melting may be slow for much of the day.

AMOUNTS: These still remain a difficult call. Across the entire northern 2/3rd of our forecast area (north of a Lampasas to Athens line), we expect anywhere from 1/10" to 1/4" of sleet to occur, with much lighter amounts of freezing rain mixed in. Again, we expect one or more heavier bands to set up, possibly producing as much as 1" of sleet in isolated areas. These bands are generally expected somewhere near a Comanche - Waxahachie - Sulphur Spring line - give or take about 50 miles on either side.

CONFIDENCE/ALTERNATE SCENARIOS: Confidence in winter impacts and general timing is high. Amounts and locations still remain somewhat uncertain. The main alternative scenario is that moisture and forcing come together more efficiently on small scales, enabling enhanced areas of sleet to occur in bands. If this process really gets going, a small number of counties will receive substantially greater travel impacts Wednesday evening/night.

We'll obviously be assessing all available data over the next 2 days, and refining the forecast accordingly. We'll issue another heads up e-mail early Wednesday. In the meantime, please don't hesitate to contact us if you have any immediate needs or questions.

Thanks,

Tom Bradshaw/Mark Fox

Sent: Wednesday, March 04, 2015 6:56 AM
To: undisclosed-recipients:
Subject: Winter Weather Update for Tonight and Thursday Morning

Good Morning South-Central Texas Partners,

Headline:

Frozen precipitation possible late this evening through Thursday morning

Area of Concern:

Cold Arctic Air - All of South Central Texas

Frozen Precipitation - The Hill Country, areas northwest of San Antonio, and northern parts of the I-35 corridor including the Austin metro area (Travis and Williamson Counties).

Threats & Impacts:

Ice Accumulations: There is a high likelihood the Hill Country will see ice accumulations, probably less than 1/10 inch. As in the previous winter events, areas farther east, including the I-35 corridor, will have a threat for icing but temperatures may not be cold enough to support widespread ice development except on bridges and overpasses.

Impacts: Bridge/overpass closures, some ice on less traveled roads, and numerous traffic accidents. At this time we are not expecting significant ice accumulation on tree branches or power lines.

Timing and Overview:

9 PM Wednesday through Noon Thursday.

An upper level storm system will bring high precipitation chances today through Thursday morning. Look for dense fog this morning across most of the area. Strong upper level winds will generate stronger lift than previous systems, so showers and a few thunderstorms are expected today before the cold front arrives late this afternoon. Arctic air behind the front will cause temperatures to fall drastically, with the Hill Country reaching freezing around 9 pm Wednesday. Northern portions of the I-35 corridor will fall below freezing shortly after midnight, including the Austin metro area.

Our current forecast is for sleet and freezing rain to begin across the Hill Country late this evening, then moving south to along and north of a line from Del Rio to San Antonio to Giddings just after midnight. This mix will continue through Thursday morning for areas along and north of Highway 90. The best chance for ice accumulation and impacts will be in the Hill Country and along the northern I-35 corridor, where temperatures will be coldest. The rain will taper off and temperatures should warm above freezing by noon on Thursday, ending the icing threat.

We're still expecting icing amounts less than 1/10 inch in the Hill Country, but only light amounts along the I-35 corridor. As in past events this year, the far southern and eastern areas will likely just see cold rain, western and northern areas (higher terrain) will probably get some ice, and areas in the middle (I-35 from San Antonio to Austin) will be stuck in the middle and could go either way. In cases like this, I-35 is literally a dividing line...colder air and ice chances in the hills, but just cold rain east of I-35.

Watch the forecast closely over the next 24 hours, there may be adjustments. There is a high likelihood that portions of the area will be under some sort of winter weather advisory or winter storm warning for late Wednesday evening through noon Thursday.

Confidence:

Arctic Air - High

Frozen Precipitation Amounts/Area - Moderate

Subject: NWS Fort Worth/Dallas Winter Weather Update

Good afternoon,

Much colder air is now spilling southward into the northern counties of Texas. Most locations north of a Comanche to Waxahachie to Sulphur Springs line will drop below freezing by mid evening, and all counties in our forecast area will be below freezing at daybreak Thursday. At the same time, a strong upper level storm system has already begun to spread rainfall throughout the region. As the cold air deepens, this precipitation will undergo a change from freezing rain, to sleet and snow tonight. Most of the precipitation will move out of the area before daybreak, with clearing skies emerging during the morning hours Thursday.

BOTTOM LINE:

As everyone knows by now, weather models yesterday evening/overnight began latching onto a scenario of stronger lift and moisture - and heavier snow and sleet accumulations - for portions of North Texas. This resulted in the need for a Winter Storm Warning for many of our counties. Our forecast remains essentially on track late this morning, and we're confident that a significant winter weather event will affect much of North and Central Texas later today and tonight. There will be considerable surface and air travel impacts - and some power impacts - for our area during the next 24 - 48 hours. All of our public safety, transportation and media partners need to be planning now in response to these impacts.

LOCATION/TIMING/AMOUNTS:

The following are our best estimates, but subject to adjustment later today/this evening:

1) along/northwest of an Eastland to Gainesville line:

* Temperatures: Drop below 32 by 3-4 pm; morning lows Thursday 21 to 25; Thursday highs 35 to 40.

* Accumulations: Around 1" snow/sleet; isolated higher amounts of 2-3"

* Impacts: Significant travel impacts on all roads through Thurs morning

2) Broad area extending from Comanche to DFW to Paris:.

* Temperatures: Drop below 32 by 6-8 pm; morning lows Thursday 25 to 29; Thursday highs 34 to 38.

* Accumulations: 1-2 inches of sleet and snow; isolated amounts of 3-4". Less than 0.10" of freezing rain possible as precipitation changes over this evening

* Impacts: Significant travel impacts on all roads through Thurs morning; isolated power outages also possible

3) Areas south of a Lampasas-Waco-Athens line:

* Temperatures: Drop below 32 in a wide window between 8 pm and 3 am (closer to 8-9 pm in Killeen/Temple/Waco areas); morning lows Thursday 28 to 32; Thursday highs 35-40

* Accumulations: Mainly averaging 1/2" sleet; up to 0.25" of freezing rain

* Impacts: Moderate to significant travel impacts on all roads through Thursday morning, especially bridges/overpasses. Potential for some power outages due to wind and ice accumulation on power lines and trees

CONFIDENCE/ALTERNATE SCENARIOS:

Our overall confidence in widespread winter precipitation and significant travel impacts across North and Central Texas is high. We have at least moderate confidence on the locations where the heaviest freezing rain, sleet and snow accumulations will be, but the banding of the precipitation tonight will result in locally higher amounts that we cannot yet pinpoint.

The main alternative scenario at this point would involve the deeper cold air arriving a bit later than now projected. This would diminish the amounts of sleet that we would see south of a Lampasas-Waco-Athens line, but could potentially increase the amount of freezing rain that we see. Partners and residents along and south of this line need to be prepared for the possibility that freezing rain amounts may be somewhat greater than currently expected in these areas overnight, with a resultant greater impact on power delivery.

We will issue another e-mail update in the 6 - 7 pm timeframe this evening. In the meantime, please don't hesitate to call our office if you have any

specific questions or needs.

Thanks,

Tom/Mark Fox

Sent: Wednesday, March 04, 2015 1:46 PM
To: undisclosed-recipients:
Subject: Winter Weather Update - 145 PM Wednesday - Corrected For Attached Graphic

Good Afternoon South-Central Texas Partners,

Headline:

Frozen precipitation expected late this evening through Thursday morning. Gusty winds also expected.

Area of Concern:

Cold Arctic Air - All of South Central Texas

Frozen Precipitation - A Winter Storm Warning is in effect for locations north of a Del Rio to Boerne to San Marcos to Georgetown line. A Winter Weather Advisory is in effect for areas along a line from Brackettville to San Antonio to Giddings.

Gusty Winds - A Wind Advisory is in effect for the same locations under a Winter Weather Advisory or Winter Storm Warning.

Threats & Impacts:

Ice Accumulations: Ice Accumulations around a tenth of an inch are expected for areas under the Winter Storm Warning, with less accumulations for areas under the Winter Weather Advisory.

Impacts: For areas under the Winter Storm Warning, expect ice accumulation on bridges, overpasses and other less-traveled roadways, which could lead to major travel problems overnight through tomorrow morning. For areas under the Winter Weather Advisory, bridges and overpasses are the primary concern

for icy patches. If locations receive greater than a tenth of an inch of ice accumulations, the high winds with gusts above 35 MPH may cause tree limbs to break easier and some power outages would be possible. The chances of this remains low at this time.

Timing and Overview:

Midnight through Noon Thursday.

An upper level storm system will bring high precipitation chances today through Thursday morning. The advertised Arctic cold front is currently nearing the northern Hill Country. Scattered showers and possibly a thunderstorm may occur before or just after the front passes through. Behind the front, temperatures will quickly fall into 40s within a couple of hours and continue to fall to near or below freezing by midnight, including the Austin metro area.

Our current forecast is for sleet and freezing rain to begin across the Hill Country late this evening, then moving south to along and north of a line from Del Rio to San Antonio to Giddings after midnight. This mix will continue through Thursday morning for areas along and north of Highway 90. The best chances for significant ice accumulation and impacts will be in the Hill Country and along the northern I-35 corridor, where temperatures will be coldest. The rain will taper off and temperatures should warm above freezing by noon on Thursday, ending the icing threat.

We're expecting icing amounts around 1/10 inch in the Hill Country, but lighter amounts along the I-35 corridor. In cases like this, I-35 is literally a dividing line...colder air and ice chances in the hills, but just cold rain east of I-35.

Northerly winds behind the front will be sustained around 20 to 30 MPH with gusts up to 40 MPH. If any locations receive greater than a tenth of an inch of ice accumulation on trees, the gusty winds could help some limbs break which could lead to power outages. As of now, this appears to be a low possibility, but it is something to be aware of.

Watch the forecast closely over the next 12 hours, there may be further adjustments.

Confidence:

Arctic Air - High

Frozen Precipitation Amounts/Area - Moderate-High

Subject: Locally Heavy Rainfall Possible Tonight and Monday

Good morning South-Central Texas Partners,

Headline:

...Widespread Rainfall Today through Monday...

...Locally Heavy Rainfall Possible Tonight and Monday - Flash Flood Watch Posted...

Area of Concern:

Along and east of a Burnet to Boerne to Pearsall line. This includes the Austin and San Antonio metro areas.

Threats & Impacts:

Rainfall: Widespread amounts of 2-4 inches in the area of concern. Isolated pockets up to 6 inches along and east of Interstate 35. Much lesser amounts of 1/2 to 1 1/2 inches will occur farther northwest...along the Rio Grande and across the northern Hill Country.

Impacts: Rapid runoff from these heavy rains could result in flash flooding of creeks and streams, low water crossings, and urban areas normally prone to flooding, as well as a pose a threat to life and property. Those locations in the Flash Flood Watch area (outlined in the green box on the attached map) will have the greatest risk of seeing these impacts.

Inline image 1

Timing and Overview:

An upper level storm system will interact with abundant moisture from both the Gulf of Mexico and Pacific Ocean today through early Monday evening. An impressive tap of moisture was seen on satellite early Sunday morning streaming out of the Pacific, across Mexico and into South-Central Texas. Several rounds of showers and isolated thunderstorms are possible today through early Monday evening. The heaviest rainfall is likely to come late Sunday night through Monday afternoon. The most favorable areas for locally heavy rainfall and potential flash flooding will be along and east of Interstate 35. Drier air will move into the area from west to east Monday night.

Confidence:

* Moderate to High on Rainfall Amounts
* Moderate on Flash Flooding

....Widespread Heavy Rains Friday Through Saturday with Flash Flooding Possible...

....A Flash Flood Watch Will Likely Be Issued For Portions of South-Central Texas For Late Friday and Into Saturday....

Area of Concern:

The greatest threat for locally very heavy rainfall and flash flooding will be along the entire Interstate 35 corridor in South-Central Texas including the escarpment and adjacent counties east of I-35. This greatest threat area includes the San Antonio and Austin metropolitan areas and is roughly bounded between a line from Carrizo Springs to Uvalde to Burnet in the west and a line from Pearsall to La Grange in the east.

Threats & Impacts:

Rainfall: Widespread rains of 2 to 5 inches can be expected with isolated totals of 6 to 8 inches from the slow moving and training thunderstorms. Lesser amounts of 1.5 to 2 inches are likely in areas outside of the

greatest threat area outlined above. See the Total Precipitation map attached below.

Several locations may experience moderate flooding with flood waters capable of causing rivers and tributaries to become swollen and overspill their banks mainly in historically vulnerable places. Small streams, creeks, canals, and ditches overflow with some low lying structures flooded. Inundation occur at underpasses, low-lying spots, and poor drainage areas. Some streets and parking lots take on moving water. Storm drains and retention ponds overflow. Flood waters may prompt several evacuations and road closures.

Timing and Overview:

An upper storm system and surface cold front will interact with a very moist airmass across the region to produce widespread showers and scattered thunderstorms Friday through Saturday night. The threat for the heaviest rainfall will increase late Friday into Saturday with the most intense rainfall and greatest threat for flash flooding likely to occur between Friday evening through Saturday afternoon. Moderate rains will continue into Saturday night. Due to the already saturated soils from recent rains, runoff may become rapid an cause flooding problems. A Flash Flood Watch will likely be issued later today for parts of South Central Texas for Friday night and into Saturday. Stay tuned for updated forecasts later today as the heavy rainfall threat area is adjusted and tuned.

Confidence:

Moderate confidence on the Rainfall Amounts.

Moderate confidence on the Flash Flooding.

To: undisclosed-recipients:
Subject: NWS Update: Severe Weather Potential Today and Wednesday

Good morning everyone,

For the first time this spring, a severe thunderstorm pattern is setting up across parts of North Texas. It's a scenario we often see this time of the year: a cold front moving in from southern Oklahoma, a dryline forming to our west, lots of moist, unstable air over us, yet the presence of a "cap" in the lower atmosphere which may suppress storm development in some areas.

While a few storms may develop late this afternoon and evening across eastern North Texas, the much better chance of severe weather will be delayed until after 5 pm Wednesday afternoon. At that time, scattered strong to severe storms will form along the dryline over western North Texas, and move into the I-20 and I-35 corridors west and north of DFW during the evening. All the activity should weaken by midnight, with drier, cooler conditions expected through the weekend.

BOTTOM LINE:

A very small chance of thunderstorms - and a minimal risk of hail-producing severe thunderstorms - is possible east of Interstate 35 and north of I-20 late this afternoon and evening. A better chance of severe thunderstorms exists for late Wednesday afternoon and evening, mainly along and north of Interstate 20 and west of I-35. Large hail and isolated damaging wind gusts are the main threat.

Neither day constitutes a significant threat of intense or widespread severe weather - particularly from the standpoint of tornadoes. However, this will serve as the first appreciable severe weather threat for most locations in

North Texas. As such, it should serve as a good test for everyone's preparedness and response processes. All EMs, media partners, public safety officials, and spotters should monitor the weather closely today and Wednesday, and be prepared for the potential for watches and warnings.

PRIMARY THREATS:

Severe thunderstorms, producing hail up to 2" in diameter, and isolated wind gusts to 60-70 mph. There is also a minimal threat of tornadoes west of Interstate 35 and north of Interstate 20 late Wednesday afternoon.

LOCATIONS/TIMING:

Isolated thunderstorms may form after 5 pm this afternoon, mainly east of I-35, and north of a Denton to Sulphur Springs line. Any storms that form today will persist in this area between 5 pm and 10 pm.

The severe threat Wednesday will be confined to areas along and west of a Comanche to Dallas to Paris line. Storms Wednesday will initially form after 5 pm, west of a Bowie to Eastland line. Initially, they'll be isolated super cells along the dryline, and comprise the greatest severe threat. The storms will eventually grow in number and merge into a broken line as they move eastward into the I-35 corridor during the 7 to 9 pm timeframe. Weakening activity will linger into eastern North Texas from 9 pm through Midnight.

CONFIDENCE:

Confidence in the development of thunderstorms over eastern North Texas today is low, and the threat of severe thunderstorms is also low. For Wednesday afternoon/evening, our confidence in the development of at least scattered thunderstorms is high, and we're also moderately to strongly confident that at least a few of these storms will be severe.

Please don't hesitate to contact Mark Fox or me if you have any specific questions, or you can certainly call our office or reach us on NWSChat.

Thanks,

Tom

To: Mark Fox - NOAA Federal
Subject: NWS UPDATE: Severe Thunderstorm Potential

Good afternoon!

We are monitoring the chances for storms, some possibly severe, across north Texas late this afternoon through tonight. The first chance for storms will be late this afternoon as a dryline moves eastward into the area. Storms are not guaranteed to develop along the dryline, but if they do, they will likely be severe, with large hail being the primary threat. If storms do form, it will likely be after 4:00pm and the areas impacted will be west of Interstate 35. The greatest risk for severe storms will be located west of Interstate 35 and north of Interstate 20. A second chance for showers and storms will occur later tonight across all of north Texas as a cold front moves through the area, primarily after 9:00pm, but this activity will have a lower threat for severe weather.

BOTTOM LINE:
There is a chance of severe thunderstorms, especially west of Interstate 35/35W after 4:00pm today. Additional rain showers and thunderstorms (likely sub-severe) are likely along a cold front that will push through north and central Texas late tonight through Thursday morning. There is not a significant threat of intense or widespread severe weather - particularly from the standpoint of tornadoes. However, this will serve as the first appreciable severe weather threat for most locations in North Texas. As such, it should serve as a good test for everyone's preparedness and response processes. All EMs, media partners, public safety officials, and spotters should monitor the weather closely, and be prepared for the potential for watches and warnings.

PRIMARY THREATS:

Severe thunderstorms, producing hail up to 2" in diameter, and isolated wind gusts to 60-70 mph. There is also a minimal threat of tornadoes west of Interstate 35 and north of Interstate 20.

LOCATIONS/TIMING:

Isolated (possibly severe) thunderstorms may form after 4:00pm this afternoon, mainly west of I-35. Additional brief showers and a few thunderstorms will be likely overnight.

CONFIDENCE:

We have moderate confidence that storms will form along the dryline late this afternoon, some of which will be capable of producing large hail. There is high confidence that additional showers and sub-severe storms will occur across most of the area late tonight.

Mike,

First step is to register for an indoor space. HamEXPO registration and event info can be found by clicking on the HamEXPO drop down (located next to the "Main" page button on the www.TARC.ORG web page. If he has a preference where his space will be located he needs to send us an Email to expo@.... We can not guarantee we can accommodate a request but we do try and accommodate requests when we assign tables and spaces.

Subject: NWS UPDATE: Severe Thunderstorm Potential

Good afternoon,

We are looking at the possibility of strong to severe thunderstorms later this afternoon and tonight across the northern portions of north and central Texas. Thunderstorms are not guaranteed to occur, and most of us will not see severe weather today. However, there is a risk for thunderstorms to develop, and those that do will likely produce severe weather. A short PDF has been attached that shows the key points, areas, and confidence. This will not be our only chance for severe thunderstorms this week, as Thursday appears to have a better chance for severe weather.

BOTTOM LINE:
There is a chance of severe thunderstorms, especially north of Interstate 20/30 today. Emergency Mangers, public safety officials and storm spotters should be prepared for the possibility of a few hours' worth of strong to severe thunderstorms. Thunderstorms near the Red River will likely be the strongest and will likely contain the largest hail. Clusters of thunderstorms are the most likely mode, with a few supercells possible.

PRIMARY THREATS:

Severe thunderstorms could producing hail up to 2" in diameter, and isolated wind gusts to 60-70 mph. There is a possibility of tornadoes near the Red River.or in close proximity to the surface front/outflow boundaries.

LOCATIONS/TIMING:

Thunderstorm initiation is anticipated between 5 PM and 7 PM, most likely near or just north of the Red River. The severe threat will remain through midnight before diminishing somewhat.

CONFIDENCE:

We have moderate confidence that storms will form late this afternoon. A limiting factor is the capping inversion, which could keep thunderstorms from developing. For those that do, there is enough instability and low level wind shear to produce large hail. The confidence is moderate for the thunderstorms to initiate, and as usual, the confidence is much lower for any one spot. All thunderstorms today will have some severe threat. Keep an eye on any splitting storms.the ones that move to the right will have a higher tornado potential, while those that move left will have a larger hail threat.

5826. VE Testing at the Ham Expo this Saturday, 18 April...

Yahoo group: Temple_ARC
Date: 2015-04-13 23:13:05 UTC
From: Joe Dorn, W5VEX
Topic: 5826 Message: 5826

BCC: my VE list

I have passed on the VE liaison responsibilities to Ross and Jan Greg. The Spring Ham Expo is this Saturday and once again we will need help from about 10 VE's.

Please respond to Jan if you can assist at: jang5@...

WARNING: there is another large event taking place at the same time we are testing. If you have any problems getting in have the gatekeepers check with us on the 2nd floor...

5827. FW: NWS Update: Severe weather potential Thursday through Saturday **** Just Spring thunderstorms projected ****

Yahoo group: Temple_ARC
Date: 2015-04-15 20:11:54 UTC
From: Joe Dorn, W5VEX
Topic: 5827 Message: 5827
Attachments: 1 described; binary payloads are missing from this source WARC

Just spring thunderstorms projected.

There are several events in the area this week end that it might impact. I am associated with three of them.

The Temple Amateur Radio Club with be having the Spring Expo with people starting to arrive on Thursday and the main event occurring on Saturday. I will be assisting with the Amateur Radio License testing on Saturday morning.

The Texas Master Gardeners will be having their state convention Thursday thru Sunday in the Dome with about 600 people expected. Sarah and I will be at the Central Texas Master Naturalists booth in the vendor area for a few hours on Thursday and Friday.

And The Central Texas Tea Party will be sponsoring a gathering on the Bell County Courthouse Lawn starting at noon on Saturday. Sarah will be assisting with the setup and I will be there after the Amateur Radio Testing is complete.

For all of you hams coming in for the EXPO, you might bring a wife or friend along. The TMG vendor area has a lot of neat outdoor and garden items on display and some free seminars. I believe vendor area admission is $2.00. There is also a very large 'G' scale model railroad that will be running in big circles. "the 'G' scale is Garden scale, a large model size.

The EXPO parking on Saturday could be atrocious so plan accordingly.

From: Tom Bradshaw - NOAA Federal [mailto:tom.bradshaw@...]
Sent: Wednesday, April 15, 2015 2:23 PM
Subject: NWS Update: Severe weather potential Thursday through Saturday

Good afternoon everyone,

After a brief two-day break, a chance of thunderstorms will return to North and Central Texas on Thursday and Thursday night, as a storm system approaches from the Southwest U.S. The best chances for showers and thunderstorms will be in the afternoon and evening hours. A few severe storms are possible, mainly west of Interstate 35/35W. Thunderstorm chances - with a potential for isolated severe storms each afternoon/evening - will continue through Saturday.

BOTTOM LINE:

While this is not expected to be a major severe weather episode, a few severe thunderstorms are possible Thursday and Thursday evening, presenting a risk of large hail and damaging winds.

It's often difficult this time of year to exclude tornadoes completely from the equation, and this event tomorrow will be no different. The setup is not ideal for significant tornadoes, but there does remain a very small chance for one or two brief tornadoes to occur. Partners in our western counties - west of I-35 - have the greatest risk of experiencing severe weather, though all areas in North and Central Texas should remain alert tomorrow afternoon and evening.

Scattered thunderstorms are expected across the region Thursday afternoon and evening. There is a threat for a few severe thunderstorms Thursday afternoon and early evening mainly west of a line from Jacksboro to Meridian to Centerville. Additional isolated severe thunderstorms are possible across all of North and Central Texas during the afternoon hours Friday and Saturday.

PRIMARY THREATS:

Large hail and strong winds will be the main threat Thursday, as well as Friday and Saturday. The chances for a tornado are very low Thursday. As always, lightning and periods of heavy rainfall will accompany any thunderstorm that occurs Thursday, as well as through the weekend.

LOCATIONS/TIMING:

Scattered thunderstorms will be possible across the region starting around noon Thursday and continuing through the late evening hours. Any severe thunderstorms that develop will be most likely to impact areas west of a line from Jacksboro to Meridian to Centerville. The most likely time period for severe weather would extend from 3 pm through 9 pm Thursday. On Friday and Saturday, if any thunderstorms become severe, it would most likely be in the afternoon and early evening hours.

CONFIDENCE:

Confidence in severe thunderstorm development Thursday is low to moderate, due to a variety of factors. Confidence in severe storms on Friday and Saturday is moderate and will depend some on the storm patterns each previous day (Thursday and Friday).

ALTERNATE SCENARIOS:

There are hints that a complex of storms may affect the Southeast Texas coast on Thursday. If this happens, it may lower the thunderstorm chances and severe potential for North and Central Texas on Thursday.

A complex of storms may also form in NW Texas/W Oklahoma on Thursday and could track into North Texas Thursday night. We will be watching the possible development of this complex and tracking its possible impacts on North Texas tomorrow.

This does not appear to be a widespread, high end event. However, because it's springtime in Texas - we have to remain vigilant with any storm systems that affect our area. Please stay alert, and don't hesitate to contact the office if you need further information.

Thanks,

Tom

To: undisclosed-recipients:
Subject: Slight Risk for Severe Storms Today through Friday over portions of
South-Central Texas

Inline image 1

Good morning South-Central Texas Partners,

Headline:

...Slight Risk for Severe Storms Today through Friday over portions of
South-Central Texas...

Area of Concern:

* This Afternoon and Evening: Along and east of the I-35 & I-37
corridors (threat Includes Austin and San Antonio metro, but the higher
threat may be just east of both areas today).
* Thursday Afternoon & Thursday Night: Primary threat along I-35 west
to the Rio Grande, although all areas of South-Central Texas are included in
a Slight Risk for Severe Weather. (includes Austin and San Antonio Metro
areas).
* Friday and Friday night: All of South-Central Texas (includes
Austin and San Antonio Metro areas).

Threats & Impacts:

Winds: Wind gusts up to 60 mph.

Hail: Large hail up to the size of golfballs

Lightning: Occasional, to potentially frequent, cloud to ground lightning with stronger storms.

Tornadoes: Very low potential for an isolated tornado.

Rainfall: Isolated pockets of 1-3 inches under heavy downpours, but most areas will receive less than 1 inch through Friday.

Timing and Overview:

Chances for showers and thunderstorms are possible over the next few days. There is good deal of uncertainty with timing and locations, and whether or not storms actually do form on some days. However, conditions are favorable that should storms develop a few could be strong to severe.

The Storm Prediction Center has placed portions of South-Central Texas in a Slight Risk for Severe Storms Today through Friday. The "Area of Concern" above lists our best forecast of timing and locations as of this writing. Timing for severe storm potential today will be primarily between 2 PM and 9 PM. Due to lower confidence, timing and location details could change Thursday and Friday, so stay closely tuned to evolving forecasts. Graphic attached is just for Today's Severe Storm Outlook. There is also a chance storms could continue across portions of the area into Saturday.

Forecast Confidence:

Low to moderate.

Home Phone: (254) 939-5918

Cell Phone:(254) 721-0829

From: Mark Fox - NOAA Federal [mailto:mark.fox@...]
Sent: Tuesday, April 21, 2015 12:41 PM
To: Mark Fox - NOAA Federal
Subject: NWS UPDATE: Severe Thundersorms

Hello,

Confidence is increasing that Wednesday afternoon and night will be an active day in north and central Texas. Thunderstorms are likely, yet not everyone will receive severe weather. Those areas which do see severe weather will likely see high impacts, including the possibility of large hail, tornadoes, damaging winds, and localized flooding. A short PDF has been attached that shows the key points, areas, and confidence.

BOTTOM LINE:
Emergency Managers, elected and public safety officials should be prepared for the possibility of significant severe weather Wednesday through Friday. There will be several rounds of severe weather beginning Wednesday and lasting through Friday. Storm spotters should be prepared for activation by the mid-afternoon hours on Wednesday.

PRIMARY THREATS:

Wednesday: Supercell thunderstorms could produce hail greater than 2☐ in diameter, damaging winds in excess of 70 mph, and tornadoes. Flash flooding is also a possibility overnight Wednesday night.

Thursday: Supercell thunderstorms could produce hail greater than 2☐ in diameter, damaging winds in excess of 70 mph, and tornadoes.

Friday: Supercell thunderstorms could produce hail greater
than 2□ in diameter, damaging winds in excess of 70 mph, and tornadoes.

LOCATIONS/TIMING:

For Wednesday: the most likely time for severe thunderstorms is between 3 PM and Midnight. However, thunderstorms could develop before 3 PM and linger much past midnight. All areas have the potential for severe thunderstorms on Wednesday. However, the highest potential will be along and north of Interstate 20, as well as areas west of US 281.

CONFIDENCE:

Confidence is moderate to high for this forecast, with a level of 7 on a 10 point scale. Confidence is high, as the necessary ingredients for severe weather will be in place on Wednesday. The combination of moisture, lift, instability, and favorable wind shear exists to produce supercell thunderstorms Wednesday. Confidence remains high for the ingredients for organized severe weather to continue Thursday and Friday.

Subject: NWS UPDATE: Wednesday Afternoon

Hello,

Confidence remains high for the potential for severe thunderstorms, especially late in the afternoon and tonight. This still appears to be the first day of an active pattern, with the severe potential remaining through Friday. Just about everyone has a threat of strong storms, yet not everyone will receive severe weather. Those areas which do see severe weather will likely see high impacts, including the possibility of large hail, tornadoes, damaging winds, and localized flooding. A short PDF has been attached that shows the key points, areas, and confidence.

BOTTOM LINE:
Emergency Managers, elected and public safety officials should be prepared for the possibility of significant severe weather Wednesday through Friday. Storms will likely develop along boundaries, including the one draped over the metroplex early this afternoon. There will be several rounds of severe weather beginning Wednesday and lasting through Friday. Storm spotters should be prepared for activation by the mid-afternoon hours on Wednesday.

PRIMARY THREATS:

Wednesday: Supercell thunderstorms could produce hail greater than 2" in diameter, damaging winds in excess of 70 mph, and tornadoes. Flash flooding is also a possibility overnight Wednesday night.

Thursday: Supercell thunderstorms could produce hail greater than 2" in diameter, damaging winds in excess of 70 mph, and tornadoes.

Friday: Supercell thunderstorms could produce hail greater
than 2" in diameter, damaging winds in excess of 70 mph, and tornadoes.

LOCATIONS/TIMING:

For Wednesday: the most likely time for severe thunderstorms is between
1-2PM and Midnight. However, thunderstorms could develop before 3 PM and
linger much past midnight. All areas have the potential for severe
thunderstorms on Wednesday. However, the highest potential will be along and
north of Interstate 20.

CONFIDENCE:

Confidence is moderate to high for this forecast, with a level of 8 on a 10
point scale. Confidence is high, as the necessary ingredients for severe
weather will be in place on Wednesday. The combination of moisture, lift,
instability, and favorable wind shear exists to produce supercell
thunderstorms Wednesday. Confidence remains high for the ingredients for
organized severe weather to continue Thursday and Friday.

Subject: NWS UPDATE: Sunday Thunderstorm Potential

Good morning everyone,

Hope you are able to enjoy the nice weather we have this Sunday morning. This afternoon and evening do not appear to be as quiet, at least for some of us. Despite the beautiful weather right now, the atmosphere is primed for severe thunderstorms to develop this afternoon, evening, and overnight. A short PDF has been attached to depict the location and timing.

BOTTOM LINE:
Emergency Managers, elected and public safety officials should be prepared for the liklihood of severe weather this afternoon, tonight, and Monday.

PRIMARY THREATS:

Supercell thunderstorms could produce hail greater than 2" in diameter, damaging winds in excess of 70 mph, and tornadoes. Flash Flooding is a possibility, especially in areas that have seen heavy rainfall in the past week.

LOCATIONS/TIMING:

The primary time frame for severe thunderstorms will be from 5 PM to 10 PM. Like most thunderstorm events in this part of the world, things are not exactly clear cut.

Thunderstorms are trying to form now, Between Noon and 5 PM, we expect isolated to scattered storms to develop in the west/southwest and move east. Between 5 PM and 10 PM, organized supercells will be more likely. After 10 PM, an organized squall line will move from west to east across the area.

CONFIDENCE:

Confidence is moderate for this forecast, with a level of 5 on a 10 point scale. The confidence is relatively low due to the spatial extent. We are certain that thunderstorms and supercells willl occur. The impacts from the storms, are expected to be high to extreme.

Subject: Enhanced Risk for Severe Weather This Afternoon Through Tonight

Inline image 1

Good afternoon South-Central Texas Partners,

Headline:

...Enhanced Risk of Severe Thunderstorms This Afternoon through Tonight Across South Central Texas...

Area of Concern:

For this afternoon and evening, the greatest area of concern will be along and north of a Del Rio to Georgetown line. This should keep the greatest severe threat west of the Austin and San Antonio metro areas for the afternoon and early evening hours. However, a second round of thunderstorms is expected during the late evening and overnight hours. This second round of thunderstorms will likely impact all of south central Texas, including Austin and San Antonio.

Threats & Impacts:

Tornadoes: Isolated tornadoes are possible.

Winds: Damaging Winds up to 70 MPH. Could cause damage to powerlines, trees, and small structures.

Hail: Up to Golf Ball Sized Hail (1.0-1.75").

Rainfall: Average rainfall of 0.25-0.5 inches, with isolated spots up to 2 inches. Flash flooding will be possible in areas that have received the greatest rainfall over the past several days.

Timing and Overview:

Daytime heating will likely generate a round of strong to severe thunderstorms across the Rio Grande Plains and southern Edwards Plateau this afternoon beginning after 2 PM. These storms will then move east into the western Hill Country this evening by 7 PM.

A more organized and widespread area of thunderstorms is then expected to develop by late evening across the southern Edwards Plateau between 7 PM and 10 PM, then spread east across the remainder of south central Texas during the late evening and early morning hours on Monday.

Confidence:

* Severe Chances: Moderate

* Flash Flooding: Low to Moderate

BE ALERT!!! This is from the Aus/San Antonio NWS but the system it is speaking of extends from Del Rio to the DFW area and it looks pretty rough. Tornados have been reported to our north already.

The line is moving fairly fast and it looks like it will hold together at least until it crosses IH-35 around midnight or a little later.

Good evening South-Central Texas Partners,

Headline:

...Enhanced Risk of Severe Thunderstorms Tonight Across South Central Texas...

Area of Concern:

For this evening into the overnight hours, the greatest area of concern will be along and north of a Del Rio to San Antonio to Taylor line. A Severe Thunderstorm Watch is in effect for these areas through 2 AM Monday, which includes the Austin and San Antonio metro areas.

Threats & Impacts:

Tornadoes: Isolated tornadoes are possible.

Winds: Damaging Winds up to 70 MPH. Could cause damage to power lines, trees, and small structures.

Hail: Up to Golf Ball Sized Hail (1.75").

Rainfall: Average rainfall of 0.5 inches, with isolated spots up to 2 inches. Flash flooding will be possible in areas that have received the greatest rainfall over the past several days.

Timing and Overview:

A line of organized thunderstorms is expected to push this evening across southern Edwards Plateau, then spread east across the remainder of South Central Texas during the late evening and early morning hours on Monday. This line of storms is forecast to push along the Interstate 35 corridor between midnight and 2 am Monday, including both the Austin and San Antonio metropolitan areas. Storms will continue to push to the east overnight affecting the southeastern counties from 3 to 5 am.

Confidence:

* Severe Chances: Moderate to High

* Flash Flooding: Low to Moderate

5848. FW: West Gulf Division Special Alert HB939

Yahoo group: Temple_ARC
Date: 2015-05-05 14:56:04 UTC
From: John Hobson
Topic: 5848 Message: 5848

CQ CQ All Hams,

Texas House Bill 939 was filed by our ARRL West Gulf Director to allow Amateur radio operators and other Texans to install emergency electric power generators when restricted by Home Owner Associations. Since the majority of new home developments have strict HOA restrictions on what the home owner can do on their property it is important for all Hams to support the passing of HB 939. The right to provide emergency power for your home is becoming more important as natural disasters with extended power outages have become more previlent in recent years. Even thought you do not like in a house with a HOA restriction you may have the issue in the future if you move to a new location. Please take a few minutes to call your Texas Congressional representative and request they vote for HR 939.

For your convenience, here are the Austin office telephone numbers for Bell County congressmen. If you are not sure which district you reside in or live outside Bell County, use the link below to identify your house district and local representative.

House District 55: Molly White (512)463-0630 Fax:(512)463-0937
House District 54: Jimmy Don Aycock (512)463-0684 Fax:(512)463-8987

73,

John Hobson, WD5BFS
H: 254-554-7705
C: 254-338-8620
jshobson@...

HB 939 - Good News!!!

HB 939 will be voted on by the Texas House of Representatives on Thursday, May 7, 2015.

We have a very, very good chance of passing this Bill - IF we have the same effort that everyone made on the cell phone bills.

As you remember, HB 939 is a bill filed by the ARRL West Gulf Division - it requires HOAs/Homeowner Associations to permit Hams & other Texans to install standby electric generators.

We need you to FAX or CALL YOUR State Representative - and only your State Representative - in whose district you live and ask them to vote for HB 939.

You may determine who is your State Representative - and their fax and telephone numbers - by going to this link and inserting your zip code or

your zip code and your address:

http://www.house.state.tx.us/members/find-your-representative/

Please DO NOT CALL OR FAX STATE REPRESENTATIVES TONY DALE, RENE OLIVEIRA OR MATT SCHAEFER. These Gentlemen are our Sponsors - they don't need to be convinced.

DO NOT EMAIL - the ONLY effective contact methods are either faxes or telephone calls.

Whether you contact your Representative by phone or fax: BE POLITE - ALWAYS - elected Representatives and their staff are not our enemies.

They want to hear from their constituents - the people who vote for them - about Bills their constituents want passed. Some staff members may ask where you are from or for your telephone number - it is ok to tell them - it makes you "real" and convinces them you are not a phony caller.

If you call or fax and their telephone numbers are busy - that is good news, because it means other Hams are calling. KEEP CALLING OR FAXING UNTIL YOU GET THROUGH.

IF YOU SEND A FAX:

We suggest the following language:

Dear State Representative XXXX:

My name is YYYYY. I am licensed by the Federal Communications Commission as an Amateur Radio Operator.

Please VOTE FOR HB 939, without amendments. HB 939 is set on the House General State Calendars for Thursday, May 7, 2015.

HB 939 permits Texas homeowners to install modern, safe, quiet standby electric generators to protect their families during electrical power outages.

Thank you for your vote for HB 939.

Signed
YYYYY

IF YOU CALL:

Please tell the staff person to whom you speak (you will not be able to speak to the Representative, because he or she will be in hearings):

(1) Your name is YYYYY

(2) You are an Amateur Radio Operator

(3) You are asking Rep. XXXX to VOTE FOR HB 939, without amendments - it is scheduled to heard by the House on Thursday, May 7, 2015

(4) HB 939 permits Texas homeowners to install modern, safe, quiet standby electric generators to protect their families during power outages

(5) Thank the Representative for his vote for HB 939.

(6) Say Goodbye and terminate the call.

Thanks.

David Woolweaver, K5RAV, West Gulf Division Director John Robert Stratton, N5AUS, West Gulf Division Vice-Director

5849. FW: West Gulf Division Reminder Legislative Alert March 2015

Yahoo group: Temple_ARC
Date: 2015-05-06 14:08:32 UTC
From: John Hobson
Topic: 5849 Message: 5849

This is a reminder for the amateur radio community by ARRL West Gulf Director David A Woolweaver, K5RAV. If you have not done so yet, please contact your local Texas House Represenative and request they VOTE YES for House Bill 939.

HB 939 - Thank You For Calling/Faxing Your State Representative

But, More Calls & Faxes Need To Be Made

HB 939 is still scheduled to be voted on by the Texas House of Representatives on Thursday, May 7, 2015.

As we said in last night's email - we have a very, very good chance of passing this Bill - IF we have the same effort that everyone made on the cell phone bills.

John Robert Stratton, N5AUS, West Gulf Vice Director and his XYL, Mary, visited the Capitol today to speak to each Representative to personally ask them to vote for HB 939. A lot of State Representatives and their staffs commented that they had been called and/or faxed by Hams, asking them to vote for HB 939 - they were impressed.

But, many of you have not yet called or faxed your State Representative. We need you to do so.

The ARRL cannot pass legislation beneficial to Ham Radio - or defeat legislation that hurts Ham Radio - unless you help us. For those who did not call or fax, we really, really need you to do so on Wednesday.

You may determine who is your State Representative - and their fax and telephone numbers - by going to this link and inserting your zip code or your zip code and your address:

http://www.house.state.tx.us/members/find-your-representative/

Please DO NOT CALL OR FAX STATE REPRESENTATIVES TONY DALE, RENE OLIVEIRA OR MATT SCHAEFER. These Gentlemen are our Sponsors - they don't need to be convinced.

5850. HamEXPO Rumors

Yahoo group: Temple_ARC
Date: 2015-05-06 14:59:39 UTC
From: John Hobson
Topic: 5850 Message: 5850

All,

There are some rumors about HamEXPO (Belton Hamfest) being spread on area HF nets that are not factual. The TARC Board would like to correct any incorrect information that is being passed around. The rumors we are being contacted about are:

1) HamEXPO rates are being increased. This is false. We are not considering increasing any fees.
2) HamEXPO will not allow anyone to tailgate in the parking lot. This is false. There has never been any discussion to disallow anyone from selling in the parking lot.
3) Main Trading Company (MTC) is not welcome at HamEXPO. This is false. HamEXPO has proactively contacted MTC several times and have coordinated indoor table space for MTC but they have not registered to attend.

If you are anyone you speak to have questions about HamEXPO we request they contact the TARC Board by email at board@.... We will be glad to answer any questions you have about HamEXPO. We will also return a call you if a phone number is provided.

Temple Amateur Radio Club Board

Subject: NWS Update: Flooding and Severe Weather Potential Today Through Sunday

Good afternoon everyone,

We are in Day 2 of a 4-day severe weather sequence for North and Central Texas. A large, intense upper level storm system will remain to our west through Sunday. Out ahead of this, the air mass over North Texas will remain moist, unstable, and primed for recurrent storm formation.

BOTTOM LINE: Many locations in North and Central Texas will receive several ADDITIONAL inches of rainfall through the weekend - promoting renewed flash flooding, and main stem river flooding, through Sunday. We'll also have enough instability to support severe thunderstorms each day. At the risk of being overly generic, lightning, hail, damaging winds - and isolated tornadoes will ALL continue be a threat.

Key point to emphasize: There will be repeated rounds of thunderstorm activity AND HEAVY RAIN across different parts of North/Central Texas today, Saturday, and Sunday. Most of this activity will be along and north of I-20, but all areas will see some impacts. Because each round leaves some environmental leftovers for the next round to work off of, it will be difficult to pinpoint the timing and locations of activity beyond about 6-12 hours in advance.

For everyone charged with making decisions based on the weather, it will be critical to keep up with the forecast on a daily - and possibly hourly - basis through the weekend. Outdoor event safety really needs to be looked

at closely, and contingencies for thunderstorms should be evaluated.

THIS AFTERNOON/TONIGHT: As clouds start to clear out across North Texas, our instability and storm potential will increase this afternoon. Scattered strong to severe thunderstorms are again expected to form initially west of a Gainesville to Comanche line by around 4 pm. We then expect these storms to increase in coverage and move eastward, affecting most areas of North Texas, north of a Comanche to Athens line, by midnight tonight. The greater I-35 corridor from Gainesville to Hillsboro can expect impacts mainly in the 6 pm to 11 pm timeframe.

A secondary area of strong storms - producing at least brief heavy rainfall and possibly some hail/strong winds - may also develop farther south over Central Texas, from the Killeen areas eastward to Palestine.

For counties close to the Red River that have already experienced flooding, be prepared for additional heavy rainfall with this next round tonight. Isolated amounts of 1-3 inches may redevelop in these areas, aggravating flooding problems. Other flood-prone areas of North Texas may also be threatened by flash flooding tonight as well.

Elsewhere across North Texas: be prepared for another sequence of severe thunderstorm - and possibly tornado warnings - anytime after 4 pm this afternoon. Areas of western North Texas will experience this activity first, moving eastward into the I-35 corridor by early/mid evening.

SATURDAY: Saturday still looks it has the potential to be a significant severe weather day for North Texas, BUT it may depend on how much shower and thunderstorm activity we get in the morning hours. A strong dryline and a piece of energy from the approaching upper level storm will join forces to trigger a first round of storms - likely non-severe across all of North and Central Texas. If this activity clears out sufficiently in the afternoon, we'll likely see a second round of stronger storms form along the dryline, west of a Bowie to Comanche line, after 4 pm. If this second round develops, these storms will have the potential to be severe with high winds, hail, and isolated tornadoes. The primary threat area Saturday/Saturday night would be north of a Goldthwaite to Hillsboro to Paris line. The widespread heavy rain threat is not quite as great Saturday, but there's still potential for isolated problems.

SUNDAY: Sunday will be another wet day, with widespread showers and thunderstorms forming by midday and continuing across all of North and Central Texas through evening. While there will again be a severe weather threat, we're actually a bit more concerned about heavy rainfall and flash flooding on Sunday. As has been the case, the greatest impacts from any flooding would be along and north of Interstate 20. The greatest threat from severe weather would be lightning, large hail and damaging winds. Tornadoes can't be ruled out, but appear to be a smaller threat than either today or Saturday.

CONFIDENCE: Our confidence in the development of repeated rounds of showers and thunderstorms - some severe, with heavy rain - remains HIGH.

Unfortunately, our confidence in pinpointing specific locations and times is low to moderate, beyond 12 hours.

We'll provide an e-mail update around midday Saturday. In the meantime, I strongly urge everyone to check our web page, Hazardous Weather Outlook, and other sources of information. In addition, please don't hesitate to shoot us a question on NWSChat, or give us a call. Because of the large volume of e-mail we're currently receiving, it may be difficult to respond to individual e-mail requests on a timely basis.

Thanks,

Tom

To: YaesuSystemFusion@yahoogroups.com
Subject: [YaesuSystemFusion] DR-1X -Internal controller observations Hi Everyone, After placing the DR-1X on-the-air yesterday, I was wondering about the "behaviour" of the repeater's internal controller. Please note that these aren't criticisms, but simply observations as I attempt to familiarize myself with the DR-1X's operation. - The DR-1X was packed up like Russian Nesting Dolls. Three corrugated cardboard boxes in total. This should eliminate any shipping mis-handling that the couriers can throw at it (and they likely did) - While I don't consider myself to be a proficient CW op, I find that the ID speed seems to be slower than 20wpm, which is what it is currently set to. - The repeater appears to only ID after there has been activity, and after the time set for the ID Interval has elapsed. - As others have indicated, the 'hang time' seems a tad long, and perhaps this could become a front panel preference in the future. - CTCSS sub-audible tone level might be a little high?, as it is very noticeable when listening to the repeater's output. - Someone in the group had mentioned about the 19" rack mounting 'ears' being reinforced to support direct attachment to the rack. After unpacking, I now concur that there is sufficient strength to permit rack installation without the need for additional support. I also expected the DR-1X to be heavier than what it actually is -it wasn't.

- The DR-1X is arguably the sexiest looking repeater that I have seen. It's almost shameful that most of these, due to their remote installation locations, will never be seen by anyone but their installers ;)

Fellas, I know that many of you are patiently awaiting yours, but in my particular case, every piece of communication that I received from Chris and Jose, including the estimated delivery time, was spot on. Considering the dock worker strike, and the sheer volume that Yeasu must be dealing with, congratulations to Chris and the Yaesu team is definitely in order. I'd like to thank Chris and the rest of the Yaesu team for this exciting, and generous DR-1X programme. 73 de Mike

Subject: Severe weather update from NWS Fort Worth/Dallas

Good afternoon partners,

Due to the active weather this morning, we weren't able to get a more detailed e-mail briefing out to everyone. Let me just share a few points and reminders:

1) This will be Day 3 of what now appears to be a 5-day severe weather sequence for North/Central Texas.

2) We will have a significant risk of severe weather today and Sunday, particularly over North Texas. A continued risk of severe weather will exist over our eastern/southern counties on Monday.

3) Virtually the same weather elements are in place today that have been present since Thursday. As such, all forms of hazardous weather, including flash flooding, isolated tornadoes, large hail and damaging winds will be possible.

4) Our greatest concern for these hazards will be generally north of a Goldthwaite to Waco to Athens line through midnight. However, ALL of our forecast area needs to stay alert.

5) A Tornado Watch is already in effect for much of our area this afternoon and this evening, and Flash Flood Warnings are in effect for many counties in North Texas.

6) Please direct any specific questions about timing and localized impacts to our NWSChat rooms, or by calling our forecast office operations numbers. We will also try to keep our graphics on our web page current, as well as our social media feeds. You can also call my cell number (listed below) if you have any kind of urgent decision support need.

7) Right now, it appears we'll get a break from widespread severe weather Tuesday and Wednesday. Unfortunately, the latter part of next week may bring a return to unsettled weather and the potential for additional severe thunderstorms.

8) We cannot overstate the importance of spreading the word about the danger of flash flooding over the next day or two. Flooding kills more people than any other type of weather hazard, except lightning. Please do whatever you can to communicate the danger of driving into flood waters - either day or night.

Thanks,

Tom

This is from EWX; FWD has their hands full with multiple Severe Thunderstorms and a Tornado headed toward Denton as I write this. Bell and surrounding counties will be under the gun later today as the training line of thunderstorms move east. Stay alert..

Mills County has had 2" hail and 60+ mph winds in the past hour.

I am monitoring on the NWS chat room and will send an email alert if needed.

Subject: ...Slight Risk for Severe Storms this afternoon and Tonight - Tornado Watch in Effect...

Inline image 1

Good morning South-Central Texas Partners,

Headline:

...Slight Risk for Severe Storms this afternoon and Tonight - Tornado Watch in Effect...

...Slight Risk for Severe Storms on Monday...

...Locally Heavy Rainfall Possible Tonight through Thursday...

Timing & Area of Concern:

* This Afternoon through Tonight: Slight risk for severe storms along and north of a Kerrville to New Braunfels to La Grange line (including Austin)

and Marginal Risk south of this line (including San Antonio). Enhanced risk for severe storms along and north of a Burnet to Georgetown line. Locally Heavy Rainfall possible late afternoon and tonight along and north of a Kerrville to New Braunfels to La Grange line (including Austin).

* Monday through Tuesday: Slight risk for severe storms across all of South-Central Texas Monday and Monday night (Includes San Antonio & Austin). Locally heavy rainfall threat possible Monday night and Tuesday along and south of Interstate 10 (includes San Antonio)

* Wednesday through Thursday: Locally heavy rainfall threat possible across portions of South-Central Texas. (includes Austin and San Antonio)

Threats & Impacts:

Severe Storms

* Hail up to golf ball sized and winds up to 60 mph

* Threat for hail larger than golf ball sized this afternoon and tonight along and north of a Kerrville to Georgetown line (see grey hatched area in attached graphic)

* Isolated tornadoes possible, especially this afternoon and tonight in Tornado Watch area (see attached graphic)

Rainfall & Flooding

* Today through Thursday: 3 to 6 inches across the eastern Hill Country and along and east of the I-35 corridor. 2 to 4 inches across the western Hill Country. 1 to 3 inches across the Rio Grande. Isolated higher amounts possible. (see attached graphic)

* Amounts are forecast over the course of 5 days.

* Given these these forecast rainfall amounts, along with current hydrologic conditions, localized moderate river flooding will be possible for tributaries and mainstem rivers in areas generally along and east of I-35 corridor. In addition, a flash flood threat of smaller creeks, streams, low water crossings, and other urban areas normally subject to flooding may also may also develop.

Overview:

A moist and very unstable airmass will interact with an upper level disturbance this afternoon and tonight, leading to scattered to numerous showers and storms. The greatest threat this afternoon and tonight will be along and north of a Del Rio to New Braunfels to La Grange line, where severe storms will be possible, capable of producing large hail, damaging straight line winds and isolated tornadoes. Locally heavy rainfall may also occur.

A weak cold front will move into South-Central Texas on Monday, resulting in a continued risk for strong to severe storms along with locally heavy

rainfall. The heavy rainfall threat may shift along and south of I-10 Monday night into Tuesday, depending on where the cold front ends up.

Long range models continue a good chance for rainfall Wednesday into Thursday, although details in exact rainfall amounts and severe potential are low at this time.

Confidence:

* Severe Potential this afternoon and Tonight this Weekend: Moderate to High

* Severe Potential Monday: Low to Moderate

* Flooding and Rainfall Amounts: Moderate

Subject: West Gulf Division HB 939 Success

HB 939 (the standby generator bill) Passed The Texas House of Representatives

By A Vote of 139-2

All of your efforts to call or fax your State Representative have paid off. Thank you.

Now HB 939 goes to the Senate, where it should be assigned by the Lt. Governor to the Senate Business & Commerce Committee.

After a hearing in front of the Senate Business & Commerce Committee, HB 939 should be sent to the Floor of the Senate for a vote on passage.

Sen. Larry Taylor, Senate District 11, has graciously consented to be our Senate Sponsor.

We will keep you up to date and at the appropriate time, will request that you contact your Senators.

Go to

pic.twitter.com/h5tpx7Pdk0 to see the House Vote Tally Board.

The only Nay votes against HB 939 were Rep. David Simpson, District 7 and Rep. Jonathan Stickland, District 92.

...A FLASH FLOOD WATCH IS IN EFFECT TUESDAY THROUGH WEDNESDAY ACROSS ALL OF NORTH TEXAS. THE WATCH IS IN EFFECT BEGINNING

TUESDAY MORNING ACROSS AREAS GENERALLY SOUTH OF THE INTERSTATE 20

CORRIDOR...THEN ACROSS THE ENTIRE REGION TUESDAY AFTERNOON THROUGH WEDNESDAY...

****
****
****
My comments..

We have a big plume of moisture working its way up from the Rio Grande toward us. Our area is under a 70% chance for heavy rain. Usually I just grin and move on, this time I think there is something to it.

Currently the moisture is approaching and crossing Interstate 10 from Ozona/Fort Stockton to Freeport/Galveston headed Northeast..

The rains should start in our area overnight and continue through Wednesday. This is the best chance we have had to get heavy rains in the Colorado and Lampasas drainage basins in several years.

I will probably be watching the resources I have when the rains get heavy.

Spotter weather and flooding reports can be listened to on the amateur radio repeater 145.310 pl123.

Make sure your weather radio is on with fresh batteries.

NOTE: This email list was initially used to give heads up to the Chaser/Spotters but I have added a lot of non-amateur radio folks so I am pointing out amateur radio facilities to them.

I cried Wolf!

Opps!!! The moisture headed east into the upper coast area and is taking interstate 10 out of Texas.

I was a little surprised when I came down this morning and all of the much need drainage basin rain was taking the short path back to the Gulf of Mexico instead of its usual northeastern track, We are still going to be in a flash flood watch until tomorrow evening and maybe, just maybe we can get some of it into the Stillhouse Hollow Lake.

Good morning South-Central Texas Partners,

Headline:

...Flash Flood Watch is in effect until 7 PM Wednesday...Threat for flash flooding this afternoon and evening continuing through Wednesday evening.

Area of Concern:

Flash Flooding concerns for all of South Central Texas due to recent rain episodes. Sections of Williamson, Travis, Hays, Caldwell, Bastrop, Lee Counties will be very susceptible to additional rainfall. (See photo below for observed rainfall totals past 7 days).

Threats & Impacts:

Rainfall: An additional 1-4 inches possible, isolated 6 inches through Wednesday evening. Most areas will get less than one half an inch...but for planning purposes, these totals are possible in more than just a few locations. This will lead to road closures and flooding along creeks and streams.

Timing and Overview:

An upper level disturbance, currently off the Baja California coast will move across the southwestern states tonight into the Southern Plains Wednesday. This will bring back a cold front that sits across the Coastal Plains tonight into Wednesday. Increase of moisture levels with precipitable water values around 2 inches along with strengthening upward motions will allow showers and thunderstorms to increase across South Central Texas this afternoon into tonight continuing through Wednesday. Expect rainfall amounts of 1 to 4 inches with isolated 6 inches possible through Wednesday evening.

Showers and storms will likely continue through the work week and upcoming weekend. So the flooding threat may last for several days. Therefore, please stay tuned and monitor closely weather conditions as upper level disturbances move across the area.

Continue to mention Turn Around Don't Drown. Best advice is to stay off the roads during times of heavy rain and even if it stops raining, the runoff will continue for hours, and in some instances, days.

Confidence:

Flooding threat - Moderate to High

5859. FW: NWS Fort Worth/Dallas Update for Heavy Rain/Severe Weather Potential ***From FWD: I think we are finally getting some water in the lakes ***

Yahoo group: Temple_ARC
Date: 2015-05-12 20:08:47 UTC
From: Joe Dorn, W5VEX
Topic: 5859 Message: 5859

From FWD: I think we are finally getting some water in the lakes.

I have heard many people say that the drought is over; I say it is not over until the ground is near saturation and the lakes are at or above their storage levels. Here at Dornville we have had a lot of flyover rains and only surface wetters have hit us. Our water supplier, Dog Ridge Water, still has us on restricted water as far as I know.

Williamson County wants our surface water and our ground water with no restrictions being applied to them that I am aware of.

Subject: NWS Fort Worth/Dallas Update for Heavy Rain/Severe Weather Potential

Good morning everyone,

Another large-scale upper trough is setting up to our west, with abundant moisture returning from the Gulf. As a result, we're facing an ongoing chance of showers and thunderstorms over our area through the weekend. The severe weather threat is LOW, until the weekend. However, some heavy rainfall and localize flash flooding is likely to occur. Considerable river and lowland flooding will definitely continue this week. Here are some key points:

FLASH FLOOD/FLOOD THREATS:

* TODAY: Flash flood threat low, overall. Average amounts will remain below 1 inch. Some spots west of a Gatesville-Weatherford-Graham line may pick up 1-2" through 6 pm, and this may aggravate existing lowland flooding that is already occurring in these areas.

* TONIGHT/WEDNESDAY: Flash flood threat moderate to high. Greatest flash flood threat west of I-35/I-35W. Average amounts 2-3 inches in this area, with isolated 4" amounts possible in our northwest counties. 1-2" possible east of I-35, with rainfall rates low in this area.

* THURSDAY: Flash flood low. Average amounts less than one half inch.

* FRIDAY/SATURDAY: Flash flood threat heightened. Some potential for new rainfall amounts of 1-3" across North Central Texas.

* Mainstream river flooding and areal flooding in low lying areas will remain a significant problem across our area through the weekend

* KEY NOTE: Please DO NOT put great focus on projected exact 5-day and 7-day rainfall totals. These are subject to considerable uncertainty. DO FOCUS on daily and shorter-term amounts that are tied to flash flooding and should be more accurate

SEVERE WEATHER THREATS:

* Threat of severe thunderstorms is low through Friday

* Large hail and damaging wind threat does increase Saturday and Sunday, especially west of I-35. Too early to tell specifics

RECOVERY OPERATIONS:

* While severe weather risk is minimal, the lightning risk will remain significant in most of the impacted areas.

* Command posts, EOC's, and other jurisdictions need to monitor weather conditions on radar for potential lightning

* Do not hesitate to use NWSChat or call WFO Fort Worth/Dallas for ANY decision support needs

We'll provide another update no later than tomorrow morning at 10 am.

Tom

Good Afternoon South-Central Texas Partners,

Headline:

...Flash Flood Watch is in effect until 7 PM Wednesday...Widespread to numerous showers and thunderstorms expected to move across the region tonight into tomorrow.

Area of Concern:

Flash Flooding concerns for all of South Central Texas due to widespread heavy rainfall expected west of I-35 and locally heavy rainfall expected east of I-35 in areas with saturated soils. Sections of Williamson, Travis, Hays, Caldwell, Bastrop, Lee Counties will be very susceptible to additional rainfall.

Threats & Impacts:

Rainfall: An additional 1-3 inches possible, with isolated spots up to 5 inches through Wednesday afternoon. Average rainfall totals will be greatest across the Rio Grande Plains and Edwards Plateau, but locally heavy rainfall will be possible across all of South Central Texas. Thus, road closures and flooding along creeks and streams will be possible west of I-35 due to heavy rainfall and east of I-35 due to saturated soils and relatively high creek

and river levels.

Timing and Overview:

Widespread to numerous showers and thunderstorms are expected to develop late this afternoon into tonight as an upper level disturbance approaches from the west and a stalled front across South Texas slowly lifts north as a warm front. Although isolated to scattered thunderstorms may develop in the Rio Grande and Coastal Plains during the late afternoon and early evening hours, the main rain event will occur overnight as more widespread showers and thunderstorms move into the Rio Grande Plains from Mexico by midnight before spreading into the I-35 corridor as early as 3 a.m. Several hours of rainfall is expected, with greater rain totals likely in the Rio Grande Plains and Edwards Plateau regions (see attached storm total rain forecast) before storms gradually weaken as they spread east. However, it will not take much rainfall to produce flash flooding in parts of Williamson, Travis, Hays, Caldwell, Bastrop, Lee Counties that are already very saturated.

The forecast past tomorrow morning is fairly uncertain as much of what occurs will depend on how much cloud cover and instability is left behind after tonight's system passes. The threat of severe weather will be greater tomorrow afternoon should storms develop along whatever boundary is leftover, particularly for areas south and west of San Antonio. Showers and storms will likely continue through the work week and upcoming weekend, so the flooding threat may continue for several days. Therefore, please stay tuned and monitor weather conditions as upper level disturbances move across the area.

Continue to mention Turn Around Don't Drown. Best advice is to stay off the roads during times of heavy rain and even if it stops raining, the runoff will continue for hours, and in some instances, days.

Confidence:

Flooding threat - Moderate

Timing of Rainfall - Moderate to High

Subject: NWS Fort Worth/Dallas Update: Severe Threats Through Sunday

Good afternoon everyone,

We're currently in a slight lull, weather-wise, but unfortunately, we do see renewed threats as we move through the coming weekend and enter the start of next week. Here are some key points:

BOTTOM LINE: Thunderstorms will remain in the forecast through at least next Tuesday. Any threats today, Friday, and much of Saturday should be limited in intensity and areal coverage. There will be additional rounds of heavy rainfall developing by as early as Saturday afternoon, and continuing through Sunday. This rain will probably create at least localized flash flooding later this weekend. Severe weather will also become a greater concern by Saturday evening and Sunday. All emergency response partners should remain alert both today and Friday, and establish heightened awareness Saturday and Sunday as the threats increase.

Mainstream can river flooding will also remain a concern in many locations as local watersheds continue to drain, and lakes continue their releases.

FLASH FLOOD THREATS:

* TODAY THROUGH SATURDAY MORNING: Flash flood threat limited. Scattered showers and thunderstorm will continue across the area through Saturday, but the duration and intensity of these should not create any new serious problems. There IS a chance that a band of thunderstorms will move into North Texas after midnight tonight and affect counties west of I-35. Right now, the amount of heavy rain associated with this activity (if it occurs)

should not be significant, but WILL be monitored. Jurisdictions along and west of I-35 should maintain a basic level of alertness through tonight for this possible activity.

* SATURDAY AFTERNOON THROUGH SUNDAY: Flash flood threat moderate. Thunderstorms will become more widespread and more intense starting in the west late Saturday afternoon and continuing area-wide Saturday night and Sunday. Widespread rainfall amounts of 1-2", with isolated amounts of 3-4" are possible through Sunday night. Renewed flash flooding will be possible, with likely locations to be refined with later forecasts.

SEVERE WEATHER THREATS:

* TODAY THROUGH SATURDAY MORNING: Very limited threat. Scattered thunderstorms are possible through this period, producing the usual lightning threats. Some small hail is a low-order possibility with a few cells through Saturday morning, but larger hail, winds or tornadoes are extremely unlikely.

* SATURDAY AFTERNOON/SATURDAY NIGHT: Elevated threat. Thunderstorms will increase in coverage and intensity later Saturday into Saturday night. Some of these may exist as super cells, while lines and clusters of storms may also occur. Given this range of storm modes, any kind of severe threat may occur across North and Central Texas during this timeframe, including large hail, damaging wind gusts, and even isolated tornadoes.

* SUNDAY: Elevated threat. Thunderstorms will continue across the area Sunday, but the severe weather risk may be greater east of an I-35 line. Large hail and damaging winds will be the main threat at this point.

MONDAY/TUESDAY:

* Continued chance of showers and thunderstorms through Tuesday. Severe weather and flash flood potential uncertain at this time, but probably less significant than Saturday's events.

* Weekend rains will have the effect of extending the duration of elevated flows on many North/Central Texas rivers

RECOVERY OPERATIONS:

* An occasional lightning threat will remain in affected areas through Saturday morning. More significant adverse weather may threaten areas by Saturday afternoon through Sunday.

* Command posts, EOC, and other jurisdictions need to monitor weather conditions on radar for potential lightning

* Do not hesitate to use NWSChat or call WFO Fort Worth/Dallas for ANY decision support needs

We'll provide another update prior to noon Friday.

Thanks,

Tom

5862. FW: N5ZXJ and W5BEC Repeaters Are Off-the-Air

Yahoo group: Temple_ARC
Date: 2015-05-17 20:36:55 UTC
From: Joe Dorn, W5VEX
Topic: 5862 Message: 5862

I have no idea about when the repeaters will be back on the air. I would expect that the ARES EC would come up with a contingency plan.

This is the fear that I have long had about having both repeaters on the same tower.

I would suggest that CTARC consider purchasing one of the new repeaters and placing it on another tower. Another alternative would be to place the old W5BEC repeater on another tower when it is replaced. We could do some fund raisers and begging to find the money needed.

Subject: N5ZXJ and W5BEC Repeaters Are Off-the-Air

Greetings All -

Just as an advisory... Due to an electrical problem on the KCEN tower, the N5ZXJ repeater on 145.310 MHz and the W5BEC repeater on 147.140 MHz, are temporarily off the air. No estimate has been given on repair time or when they'll return to the air.

As always, hope for the best.

Rick, K6WXA

Sent: Tuesday, May 19, 2015 1:51 PM
To: Mark Fox - NOAA Federal
Subject: NWS UPDATE: Additional Thunderstorms

Good afternoon,

As you know, we continue to deal with thunderstorms and the potential for heavy rainfall. Additional showers and thunderstorms are occurring now, and will increase in coverage later this afternoon and tonight. A flash flood watch is in effect for about half of the area, and a tornado watch is already in effect for two of the 46 counties in our warning area. A short PDF has been attached, and focuses mainly on today.

BOTTOM LINE:
Emergency Managers, elected officials, and public safety officials should actively monitor the weather for the remainder of this week and weekend for the possibility of heavy rain and for the possibility of severe thunderstorms. Areas which have already seen flooding in the past week or so should be especially mindful of any additional heavy rainfall for additional flooding problems. The risk of thunderstorms exists today and for the next several days. This continues to be a long, drawn out event which will last (non-continuously) through Memorial Day.

PRIMARY THREATS:

Today: There is a potential for a few severe thunderstorms today and tonight. The primary risk for the majority of the area will be from localized heavy rainfall, flash flooding, and ongoing river flooding. Any discrete supercell thunderstorm which is able to develop will have a higher potential for severe weather, including hail, damaging winds, or a tornado.

LOCATIONS/TIMING:

The most likely time for severe thunderstorms is now through sunset (8-9PM). There are additional signs for another round of overnight storms, where the flooding potential will be highest. Areas to the west of US 281 have the highest potential for localized heavy rainfall. Additionally, areas along and near the Red River will likely see heavy rainfall during the overnight hours.

CONFIDENCE:

Confidence is moderate with this forecast, about a 6 on a 10 point scale. Confidence is high in that the area will see additional rainfall today. Confidence is less for exact areas to be impacted.

Subject: Flooding and Flash Flooding Threat through the Memorial Day Weekend
- Turn Around, Don't Drown.

Inline image 1

Good morning South-Central Texas Partners,

Headline:

...Strong to Severe Storms with Locally Heavy Rainfall & Flash Flooding
Possible Late Afternoon and Tonight...

...Stormy Pattern Continues Beyond Tonight, Especially Saturday Night
through Memorial Day - Flash Flooding and River Flooding Threat Continues...

Timing & Area of Concern:

* Late This Afternoon & Tonight: Scattered to numerous showers and
storms producing locally heavy rainfall along and north of an Elgin to
Boerne to Carizzo Springs line. (this includes Austin). A few severe
storms possible.
* Thursday & Thursday Night: Scattered showers and storms producing
locally heavy rainfall, primarily south of Interstate 10. (this includes
the San Antonio)
* Saturday Night - Memorial Day: Numerous showers and storms across
all of South-Central Texas, producing locally heavy rainfall. (this
includes Austin and San Antonio)

Threats & Impacts:

Rainfall:

* Locally 1 to 3 inches possible late this afternoon and tonight along and north of an Elgin to Boerne to Carizzo Springs line.
* Total rainfall amounts Today through Memorial Day will average 2 to 4 inches with isolated amounts of 6 inches.
* Flash flooding of small streams, creeks, canals, ditches and low water crossings are likely at some point through the Memorial Day Weekend, prompting road closures.
* Some main rivers and tributaries could rise back into flood stage.

Severe:

* Hail up to golfball size and damaging wind gusts up to 60 mph late this afternoon and tonight along and north of an Elgin to Boerne to Carrizo Springs line.
* Large hail may cause damage to vehicles and anyone caught outdoors could face serious injury. Severe winds gusts may cause damage to mobile homes, porches, and awnings. Large fallen trees or excessive cloud to ground lightning could produce scattered power outages.
* Frequent cloud to ground lightning possible with some storms today through the Memorial Day Weekend.

Safety Messages and Facts (For use in PIO, Social Media, etc)

* Turn Around Don't Drown.

* In South Central Texas, we lose more people to flash flooding than any other weather hazard.

* Do not drive around barricades, its against the law, plus its deadly.

* Driving at night in heavy rain is particularly dangerous - the majority of our flash flood fatalities occur in vehicles while driving at night.

* In these conditions, flooding and road closures will continue days after the rainfall has ended.

* Be "Weather Aware" over this week and into the Memorial Day weekend.

* Any given day or night this week, thunderstorms may form and quickly produce 2-3 inches of rain in less than an hour.

* If caught outside during a thunderstorm, move immediately indoors. If no building is available, your vehicle is a safe alternative from lightning. Stay away from trees, utility poles, and metal fences.

* With the Memorial Day weekend coming up and with the increased flows in area creeks and rivers, outdoor enthusiasts such as kayakers, tubers, etc will want to hit the water even if the waterway is closed to recreation. During these strong flow conditions, head the warnings and closures that local officials have in place...it will save your life.

Inline image 1

Inline image 2

Overview:

South-Central Texas will remain in an active weather pattern through the Memorial Day Weekend. There will be chances for storms every day from Today through Memorial Day. The biggest concerns will be late this afternoon and tonight and again Saturday Night through Memorial Day. The risk for strong to severe storms with locally heavy rainfall will increase late this afternoon and Tonight as a cold front works into the area, especially along and north of an Elgin to Boerne to Carrizo Springs line. The threat for storms will continue primarily along and south of Interstate 10 Thursday and Thursday night, and across all of South-Central Texas Friday through early Saturday. More numerous showers and storms are expected with a strong upper level disturbance Saturday Night through Memorial Day.

Locally heavy rainfall will be a possibility each day with some storms. Given the saturated soils in some areas of South-Central Texas, any additional heavy rainfall will quickly lead to flash flooding. Impacts are potentially higher when combined with recreational activities over the holiday weekend, A Flash Flood Watch could be required later this week or over the holiday weekend.

Confidence:

Moderate to High

Sent: Thursday, May 21, 2015 2:27 PM
To: Mark Fox - NOAA Federal
Subject: NWS UPDATE: Thunderstorms and Additional Flooding Through Memorial Day

Good afternoon,

We remain in an extremely moist and unsettled weather pattern - a pattern that continues to give us a potential for locally heavy rainfall, flooding, and severe weather. This pattern will continue and actually intensify on Saturday and Sunday. A short PDF has been attached, and focuses mainly on today. (Some of you will notice.the maps toward the end are done in order of threat, and are not in chronological order)

BOTTOM LINE:
The Memorial Day Weekend will be an active one for North and Central Texas. Severe weather and flash flooding will both be significant risks. Emergency Managers, elected officials, and public safety officials should actively monitor the weather for the remainder of this week and weekend. Everyone should be prepared for severe thunderstorms and/or additional flooding from Saturday afternoon through Sunday evening. With the current rainfall forecast, some rivers will likely reach major flooding stages.

As we've stressed, don't overly focus on 5-7 day rainfall total graphics. The nature of the current thunderstorm activity is challenging our models and human expertise in terms of accurately pinpointing the location, timing and amounts of rainfall that we'll see, more than about 1-2 days in advance. Because of this, you must keep up with forecasts, advisories and warnings on a daily, and semi-daily basis.

TIMING/LOCATIONS OF THREATS:

* TODAY/TONIGHT: Fortunately, threats will be limited. We'll see additional scattered showers and thunderstorms form later this afternoon/evening, mainly across our central Texas counties. However, we don't expect any organized severe weather or significant flash flooding.

* FRIDAY: Scattered showers and thunderstorms will return across our region, and they'll be a bit more widespread - particularly in North Texas closer to the Red River. While we don't currently expect significant flash flooding, a few spots north of I-20 may experience localized excessive rainfall and some renewed small stream and urban flash flooding. The severe weather threat will be low, but some potential for large hail and damaging wind will exist - mainly west of I-35 in the afternoon and evening.

* SATURDAY: Thunderstorms will increase in coverage - and likely in intensity as well. Areas north of I-20, and especially counties in our northwest and closer to the Red River will have a significant threat of excessive rainfall and flash flooding. Localized 24-hour rainfall amounts of 2 to 4" are possible. All other locations in North and Central Texas will have at least some risk for heavy rain and flash flooding as well. Severe weather potential will also increase over western North Texas and our counties closest to the Red River, particularly after 2 pm Saturday and continuing through midnight Sunday. In addition to large hail and damaging winds, there will be at least a small potential for brief tornadoes, with the greatest threat area again being north of I-20.

* SUNDAY: Continued widespread showers and thunderstorms. A moderate to high flash flood risk will continue across all of North and Central Texas throughout the morning and daytime hours. Additional 24-hour rainfall amounts of 1 to 2" are possible. The severe weather risk will also persist, with the main threat being large hail and damaging winds.

* MEMORIAL DAY: Showers and thunderstorms will remain over the region, but perhaps not quite as numerous or intense as they're expected to be on Saturday and Sunday. Localized rainfall rates may be sufficient, however, to produce additional small-scale flash flooding on Memorial Day, however. Thunderstorms may also be severe, with at least small hail, gusty winds, and frequent lightning.

CONFIDENCE:

Overall confidence is moderate with this forecast, about a 6 on a 10 point scale. Confidence is high that we'll see significant impacts across parts of our area on Saturday or Sunday. Our main uncertainty centers on the precise timing and locations of the renewed flash flooding impacts.

To: undisclosed-recipients:
Subject: Weather Update 300 PM Thursday...There is a Flash Flood/Severe threat overnight with Locally Heavy Rain possible...

Good afternoon South-Central Texas Partners,

Headline:

...Locally Heavy Rainfall Possible Overnight...Flash Flood Watch in effect for much of the area Tonight through 7AM Friday...

Area of Concern:

All of South Central Texas...Emphasis on areas in the Hill Country and I-35 Corridor, including areas that have been hit so hard in the past week and where there is ongoing search and rescue.

Threats & Impacts:

Rainfall: Some areas could see an additional 1-2 inches with isolated 3 inch rain totals. We will likely NOT see the type of totals that caused the Saturday Night flood...but with the soil so saturated...it wont take as much rain to see significant rises in creeks/rivers as well as urban/rural flash flooding.

Severe: There will be a slight risk of severe weather as well. As we have seen over the last several days, the severe hail reports have been minimal but the wind damage and even small tornadoes have been on the increase. All these mentioned threats are possible at this point. Nothing can be ruled

out.

Timing and Overview:

A few scattered showers and thunderstorms will continue through the afternoon. Later tonight we will see an increase in thunderstorms over west Texas and this activity is expected to organize and move into the Hill Country later tonight and then possibly toward the I-35 corridor after midnight. Rainfall of 1-2 inches is possible with isolated higher totals possibly as high as 3 inches. Too early to tell exactly where and when the heaviest totals will occur. Will have to watch the radar trends after the storms have developed to get the best feel on where the largest flash flood threats will develop. Keep a weather watch overnight.

Additional rain chances are possible on Friday and even the weekend as a front approaches the area. Several scenarios are possible...some with low chances of rain, some with high. We are trying to take it day by day as storm systems affect the next days forecast and storm development. Check the forecast frequently.

Confidence:

Flash Flooding - Moderate to High

Severe - Low to Moderate

Additional Information Resources:

Subject: NWS UPDATE: Additional Thunderstorms and Flooding

Good afternoon,

As has been the case for the entire month of May, the air mass over North and Central Texas will remain very moist and unstable. In addition, we have multiple weak impulses in the middle part of the atmosphere - and boundaries at the surface - that will help to trigger multiple rounds of thunderstorms today through Saturday night. Fortunately, our longer-term guidance still suggests a drier pattern starting Sunday and continuing most of next week. A short PDF has been attached to help with visualizing timing and potential impacts.

BOTTOM LINE: At least 2 periods of thunderstorm activity will occur over North and Central Texas through late tonight - both bringing the threat of localized flash flooding. Scattered strong to locally severe storms will develop just about anywhere across our area from midday on through early evening.

Later this evening, a larger organized thunderstorm complex will move into our area from west Texas, bringing one or two lines of thunderstorms with locally heavy rain across most of North and Central Texas during the evening and overnight hours. Renewed flash flooding - and more river flooding - will be a significant risk, as will isolated large hail and damaging winds. More rain is expected Friday and Saturday, so emergency managers, public

safety personnel, and media partners will need to remain alert to current forecasts and warnings through Saturday.

TIMING/LOCATIONS/THREATS: Scattered thunderstorms will initially form [where??] by early afternoon. Locally heavy rainfall and a threat of large hail and strong wind gusts will accompany these storms.

A larger thunderstorm complex will begin approaching North Central Texas from the west by early evening, and should enter our western counties - west of a Bowie to Goldthwaite line - by 8 pm. This complex of storms will probably organize as one or two separate lines with additional storms out ahead of it as it moves eastward. Broad areas along the I-35 corridor from Gainesville to Temple can expect this next round of storms - and heavy rainfall/flash flooding - during the 9 pm to Midnight timeframe, with areas east of I-35 experiencing these conditions from 11 pm through 4 am. In addition to flash flooding, large hail and damaging wind gusts are possible. The tornado threat will be very low, but cannot entirely be ruled out due to the large amount of instability in the atmosphere.

LOOKING AHEAD: Additional periods of thunderstorms are expected later Friday through Saturday evening. Right now, it is difficult to time these next rounds of storms, because they're somewhat dependent on the existence of boundaries and residual cloudiness/stable air left over from previous activity. We are confident, however, that a significant flash flood risk - and a lesser risk for severe thunderstorms - will continue over most of North and Central Texas through the first half of the weekend. Jurisdictions will thus need to remain prepared (and likely activated). We'll continue to refine this forecast over the next day or so.

CONFIDENCE: Our confidence in the development of new thunderstorms with flash flood, hail and high wind potential is moderately high - 7 out of 10. We're also relatively confident that the most significant round of storm activity will occur this evening and overnight for most areas.

I have the following for sale. If intersted contact ki5marrl@gmail.com
Do not send to my other Email addresses or you message may be overlooked.

1. Icom 2100h with Tiny Track 3 plus (works fine HTTP://aprs-fi and search for ki5m)
2. Kenwood TH-F6 with triband Diamond Antenna (receives shortwave SSB,AM, FM)
3. Icom ID-800 D-Star with box, like new and with cables to program (purchased from AA5RT last year)
4. Yeasu VX-2 talkie (fits in pocket) with 2nd battery (both good).
5. Kenwood R-2000 receiver AM/FM/USB/LSB/CW reciever. 100KHz to 30MHz Looks almost new, works fine.

All lights and readout work fine, knows in great condition. This is a receiver, not a transmitter.

ALL the above transcievers/talkies come with programming cables and software and power adapter for the talkies. I have a 13.8 volt power supplie if someone wants to use the 2100h in their home.

My other items are not for sale, so don't ask.

Mike Hankins, Ki5m

Empty the lakes, floods are a'coming.

This is from the south Texas NWS. I expect others to tune in also.

There is growing concern about a system developing in the GOM. Houston is alerting its folks. stay tuned.

We are enjoying a June rain as I write.

Subject: Heavy Rainfall Threat and Tropical Update - 4 PM June 14

Inline image 1

Good afternoon South-Central Texas Partners,

Headline:

...Locally Heavy Rainfall threat Continues along and east of I-35 this Afternoon and Evening and again Monday...

...Monitoring the Gulf of Mexico for Potential Tropical Development...

...Heavy Rainfall Threat and Flooding Possible across Portions of South-Central Texas Late Monday Night through Wednesday Night...

Area of Concern:

* Tonight: Along and east of I-35 this evening and Rio Grande Plains and western Edwards Plateau overnight.

* Monday: Along and east of I-35.

* Late Monday - Wednesday Night: Portions of Hill Country, I-35 corridor, and points east.

Threats & Impacts:

Rainfall:

* This Afternoon through Monday Afternoon: 1 to 2 inches with isolated amounts over 3 inches possible in areas described above.

* Late Monday Night through Wednesday Night: 2-4 inches along and east of a Georgetown to Karnes City line with isolates amounts of 6 inches possible. 1-2 inches with locally higher amounts along the I-35 corridor and eastern Hill Country. Given the saturated conditions across much of the area, any additional heavy rainfall could lead to high impact flash flooding and river flooding. Rainfall amounts below 1 inch generally expected elsewhere. This line of heavy rainfall could shift farther east or west and amounts could be higher or lower as details on a potential tropical system become clearer (see overview below).

Wind:

* Monday night through Tuesday night: Too soon to determine, but the stronger winds will likely be located across Southeast Texas.

Timing and Overview:

Scattered showers and thunderstorms are again occurring along and east of I-35 Sunday afternoon, with some storms producing locally heavy rainfall and isolated flooding. A Flash Flood Watch remains in effect for these areas through this evening. These storms will diminish after sunset. Additions showers and storms are possible overnight west of a line from Rocksprings to Bracketville, across the Rio Grande and western Edwards Plateau. Scattered showers and thunderstorms with locally heavy rainfall are expected to develop again on Monday along and east of I-35.

We continue to monitoring an area of low pressure that has now moved off the Yucatan and into the southwest Gulf of Meixco. As of this writing Sunday afternoon, a Hurricane Hunter aircraft was enroute to the system to investigate. Environmental conditions are expected to become more and more favorable for development of the system into a tropical cyclone over the next 24 to 36 hours, and a tropical cyclone could form at any time. This system will track northwest through the Gulf of Mexico on Monday and approach the mid or upper Texas coast by early Tuesday. As of Sunday afternoon, the National Hurricane Center had increased the likelihood of this system developing into a tropical cyclone to 70%.

The exact track and strength of this system will dictate exact rainfall amounts and impacts across South Texas. Until an actual circulation closes off and the tropical system forms, changes in model tracks are likely, and could result in large changes to the forecast.

At this time, our forecast reflects a consensus approach of models as well as guidance from the National Hurricane Center. We are currently

forecasting rainfall from this system to impact primarily locations across the eastern Hill Country, I-35 corridor, and points eastward late Monday night through Wednesday night. The greatest rainfall threat will be along and west of a Georgetown to Karnes City line, where 2 to 4 inches with isolated amounts of 6 inches will be possible. 1 to 2 inches with locally higher amounts are forecast along the I-35 corridor and eastern Hill Country. Rainfall amounts below 1 inch generally expected elsewhere. This line of heavy rainfall could shift farther east or west and amounts could be higher or lower as details on this potential tropical system become clearer.

Given the saturated conditions across much of the area, any additional heavy rainfall will lead to high impact flash flooding and river flooding. Flash Flood Watches will likely be required for portions of the area Tuesday through Wednesday night.

At this time it is soon to determine impacts from wind, but the stronger winds will likely be located across Southeast Texas.

Although confidence continues to increase on the development of a tropical system, we heavily caution that shifts in the track of this system and change in its organization or lack thereof canl cause large changes to the forecast across South-Central Texas. Please closely monitor forecasts from the National Hurricane Center as well as your local National Weather Service Forecast Office here in Austin-San Antonio over the next couple of days as details become more certain.

Please see the attached pdf for graphics.

Confidence:

Moderate

5873. FW: NWS Fort Worth/Dallas Hazardous Weather Update for Gulf Tropical Disturbance ****Bell County is on the dividing line again ****

Yahoo group: Temple_ARC
Date: 2015-06-15 18:10:42 UTC
From: Joe Dorn, W5VEX
Topic: 5873 Message: 5873
Attachments: 1 described; binary payloads are missing from this source WARC

It appears that Bell County is on the dividing line again. East Texas may have a wash-out. The path is still up in the air but pretty much any changes will just add a little westward territory. I would have liked it if it had come in south of Corpus and headed up the Colorado River basin; Lake Buchanan still has a lot of storage space.

To: undisclosed-recipients:
Subject: NWS Fort Worth/Dallas Hazardous Weather Update for Gulf Tropical Disturbance

** Apologize for the delay - we're seeing some very late guidance that suggests the system may move a bit slower than we previously thought. Timing below reflects that possibility. **

Good morning,

We're monitoring a tropical disturbance in the west central Gulf of Mexico, which is expected to move through central and northern Texas Tuesday and Wednesday. This system, while relatively fast moving, has the potential to bring renewed flash flooding and river flooding to much of the region. A briefing .pdf is attached.

BOTTOM LINE: This system will be a prolific rain producer, and flash flooding will be a major threat Tuesday through Wednesday morning. Depending on exactly which basins are impacted, some renewed significant river flooding is also possible, particularly the Trinity, from Wednesday on through the rest of the week. Emergency managers, government and media public safety partners should monitor forecasts and warnings closely, and begin making preparations for flooding impacts.

TIMING: The primary window for heavy rainfall over North and Central Texas will be 3 pm Tuesday through 6 am Thursday. Within that broad window, we're

most concerned about intense rainfall occurring in some locations (mainly along/S of I-20) during the nighttime hours Tuesday night/Wed morning (8pm-8am), and again (area wide) Wednesday night/early Thursday (6pm - 6am). As time wears on, the probability of the heaviest rain will gradually shift northward from central Texas (Tues/Wed) into North Central/Northeast Texas (Wed/Thurs AM).

LOCATIONS: It's critical not to focus on any specific track forecasts. The rainfall with this event will be distributed across a fairly wide swath, primarily along and east of the I-35/I-35W corridor. We expect widespread 2 to 4 inch rainfall amounts across this portion of North Central Texas through early Thursday. Within this broader area, localized 4 to 8 inch amounts are expected. Areas west of I-35 will still see rainfall, but widespread amounts should be less than 2 inches, and impacts should be more isolated.

IMPACTS: Flash flooding will be the dominant impact with this event, and could be quite significant where intense rainfall occurs Tuesday night, and again Wednesday night. This will particularly be the case in urbanized areas and other smaller basins where runoff occurs very quickly. Renewed river flooding - particularly on the Trinity and Sabine - are also possible if the forecast high end rainfall amounts materialize over those basins. West Gulf River Forecast Center, WFO Fort Worth/Dallas, and the Corps of Engineers continue to monitor these river systems closely.

A secondary impact may be the development of brief, spin up tornadoes in the outer bands of the tropical system Tuesday afternoon, evening, and early Wednesday. These kinds of weak, shallow tornadoes often develop very quickly, providing little opportunity for major lead times.

Right now, we do not expect any significant impacts from tropical winds.

CONFIDENCE: Our confidence in the development of widespread heavy rainfall and flash flooding is high - 8 out of 10. We have high confidence that the bulk of the impacts will be confined to areas along and east of the I-35 corridor. The only thing that could change our forecast significantly would be if the system were to slow down from its anticipated forecast speed. While this does not appear likely, any slowdown would subject North and Central Texas to locally higher rainfall amounts (over 8 inches). We will monitor this possibility very closely over the next 24 hours.

As always, WFO Fort Worth is ready to help with forecasts and decision support in any way. Don't hesitate to call, NWSChat, or e-mail us if you have any needs. We will issue another briefing package Tuesday morning.

Thanks,

Tom Bradshaw

Subject: Tropical Storm Bill Forms - Headed for Texas Tuesday

Inline image 1

Good evening South-Central Texas Partners,

A late evening update for the formation of Tropical Storm Bill:

Locally Heavy Rainfall and Flooding Likely across portions of South-Central Texas Tuesday through Wednesday Night

Tropical Storm Conditions Expected across Far Eastern Areas.

Updates Since Last Briefing:

* Tropical Storm Bill has formed in the northwest Gulf of Mexico

* Tropical Storm Warning issued for DeWitt, Gonzales, Lavaca and Fayette counties

* A Flash Flood Watch is in effect from Today through Thursday morning for eastern areas, including the I-35 corridor and portions of the eastern Hill Country.

Threats & Impacts:

Rainfall:

* Tuesday through Wednesday Night: 2 to 6 inches of rain along and east of U.S. 281 (including Austin and San Antonio). Isolated amounts of 8 to 10 inches along and east of an Austin to Cuero line. Lesser amounts of 1/4 to 1 1/2 inch across the western Hill Country and Rio Grande.

* Heavy rainfall will likely lead to high impact flash flooding along with moderate to major flooding of some rivers and creeks in the Flash Flood Watch area. Some locations may experience flood waters capable of causing rivers and tributaries to overflow their banks in several places. Small streams, creeks, canals, and ditches could become dangerous rivers with flood waters spreading well away from the banks. Widespread inundation of both primary and secondary roads are possible. Flood waters may prompt some evacuations and road closures.

Wind:

* Late Tuesday morning through Tuesday Evening: Tropical Storm Force winds of 30-40 mph with gusts to 50 mph near and south of a La Grange to Gonzales line. Wind speeds of 25 to 35 mph with gusts near 40 mph possible as far north as Austin late Tuesday afternoon and evening. Lesser wind speeds southwest of the track.

* In the Tropical Storm Warning Area: Unsecured lightweight objects will be blown about. Large tree limbs could be broken off. A few trees could be snapped or uprooted, especially in areas that are saturated. Some minor damage to fences and signs are possible.

Tornadoes:

* Tuesday: Low chance of isolated tornadoes during the day Tuesday east of a Bastrop to Cuero line.

Timing and Overview:

Tropical Storm Bill has formed in the northwest Gulf of Mexico. Bill is expected to make landfall along the Mid Texas coast Tuesday morning and track into Central Texas Tuesday night.

At this time we are currently forecasting rainfall from this system to impact primarily locations across the eastern Hill Country, I-35 corridor, and points eastward Tuesday through Wednesday night. The greatest rainfall threat will be 2 to 6 inches of rain along and east of U.S. 281 (including Austin and San Antonio). Isolated amounts of 8 to 10 inches along and east of an Austin to Cuero line. This heavy rainfall will likely lead to high impact flash flooding along with moderate to major flooding of some rivers and creeks in the Flash Flood Watch area. We are growing increasingly concerned about heavy rainfall with the track of the storm through the area during the day on Tuesday, and more so late Tuesday night into Wednesday morning, where a heavy rainfall band could set up over a portion of the area, despite Bill weakening and moving north of the area.

Given the saturated conditions across much of the area, any additional heavy rainfall could lead to high impact flash flooding along with moderate to major flooding of some rivers and creeks. A Flash Flood Watch is in effect

for the eastern half of the area, including the I-35 corridor.

Sustained tropical storms force winds could produce tree damage across the Tropical Storm Warning area. Gusts near or to tropical storm force are possible as far north as Austin. There is a low chance for isolated tornadoes across the far east during the day on Tuesday.

Please see attached pdf for graphics.

Confidence:

Moderate to High

Subject: Tropical Storm Bill - Evening updated (corrected for header/footer images)

Inline image 1

Good evening South-Central Texas Partners,

Headline:

Center of Tropical Storm Bill moving north across Fayette, Lee, and Bastrop Counties

Heavy rainfall moving north associated with the center along with wrap around rain bands in the Hill Country

Dangerous Flash Flooding remains the highest threat overnight and through Wednesday as redevelopment of rain bands occur.

Updates Since Last Briefing:

* Tropical Storm Bill's wind field is slowly shrinking but some sporadic gusts as high as 39 MPH have occurred in Lavaca and Fayette counties over the past few hours.

* Tornado Watch remains effect through midnight for areas mainly along and east of Bill's track.

* Below are a series of 12 hour rainfall totals starting 1am tonight through 1am Thursday night. the first graphic will be form 1am tonight

through 1pm Wedensday and so on. The rainfall graphic on our webpage and that has been sent through these emails is cumulative rainfall totals through Thursday morning. It must be stressed that these overall totals will accumulate through periods of heavy rain. There will likely be lulls in between the heavy rain periods.

* Partners...please stress the need for residents to remain alert through the overnight hours, especially for those that live in low lying areas or live by creeks/rivers. A high level of awareness will need to be maintained overnight into Wednesday. A landfalling tropical system after a record May rainfall can and may lead to another record event for somebody in or near South Central Texas. Stay alert to rapidly changing weather conditions.

Threats & Impacts:

Rainfall:

* Overnight through Thursday morning: 3 to 6 inches of rain along and east of U.S. 281 (including Austin and San Antonio). Isolated amounts of 8 to 12 inches along and east of an Georgetown to Cuero line. Some highly localized higher amounts towards 15" may be possible as well. Lesser amounts of 1/4 to 1 1/2 inch across the far western Hill Country and Rio Grande Valley.

* Heavy rainfall will likely lead to high impact flash flooding along with moderate to major flooding of some rivers and creeks in the Flash Flood Watch area. Some locations may experience flood waters capable of causing rivers and tributaries to overflow their banks in several places. Small streams, creeks, canals, and ditches could become dangerous rivers with flood waters spreading well away from the banks. Widespread inundation of both primary and secondary roads are possible. Flood waters may prompt some evacuations and road closures.

Wind:

* Through 1am: Low end Tropical Storm force winds of 30-40 mph with slightly higher gusts are possible near and south of a La Grange to Gonzales line. Wind speeds of 20 to 35 mph are possible as far north as Austin tonight. Lesser wind speeds southwest of the track. Winds will weaken as a whole after 1am with sustained winds 15-125 mph closer to the center with weaker winds farther southwest of the center.

* In the Tropical Storm Warning Area: Unsecured lightweight objects will be blown about while we could also see isolated tree/branch damage. Some minor damage to fences and signs are possible.

Tornadoes:

* Late evening: Very Low chance of isolated tornadoes now through midnight east of a Burnet to New Braunfels to Cuero line. Tropical tornadoes tend to be brief with short damage paths (EF0 and EF1).

Overview:

The latest Tropical Storm advisory has Tropical Storm Bill located 20 miles west of Port O'Conner with maximum sustained winds near 40 mph and moving north near 10 MPH. The center of Bill will continue to move north across Lee, Bastrop and far eastern Williamson counties over the next few hours then continue towards Dallas through the early morning.

While there could be a lull in heavy rain for the I-35 corridor overnight, numerous models suggest redevelopment of rain bands Wednesday morning and afternoon similar to the one off the Texas coast right now. This could set-up somewhere over the region and pose a significant risk for flash and river flooding despite the center of Bill moving away of the region. This heavy rainfall could lead to high impact flash flooding along with moderate to major flooding of some rivers and creeks in the Flash Flood Watch area.

Remember...A Flash Flood Watch is in effect for central and eastern portions of the area, including the I-35 corridor.

Confidence:

Heavy Rain: High

Flash Flooding: High

River Flooding: High

Tornadoes: Low

Next Briefing:

Wednesday by 7am

5881. 4th of July Parade

Yahoo group: Temple_ARC
Date: 2015-07-02 21:43:40 UTC
From: Darwin Geiselbrecht
Topic: 5879 Message: 5881

What follows is my standard message about the Parade. The only change this year is they want us there at 6:30 to pick up the golf carts. That seems a bit early but it is part of their overall schedule. So we'll have to drag out of the sack a little earlier than usual.

Once again, it is nearing time to help line up the entrants in the big July 4th parade Saturday in Belton. This is a good opportunity to use our communications gear for a good cause.

I know most have helped in years past. For those who are new to the process, this is a communications exercise using hand held transceivers. If you don't have a handi-talkie, come anyway and we will pair you up with someone who does. We will use the Belton repeater on 147.3 with a 123 PL tone. This has always given us excellent coverage.

We will meet Saturday July 4, at 6:30. We will meet at our usual spot in the parking lot that is at the first left off 10th street after going in the main entrance of University of Mary Hardin Baylor (UMHB) at the corner of 10th and 317. Maps and lists will be available then.

I have been told by the Chamber of Commerce that the only change from last year is they promise a few more porta-potties and they said we should have an extra cart or two. Like last year, the horses will line up on the north side of the tracks in the fenced off area.

The chamber has promised us golf carts, so if you have a limitation concerning standing or walking, we should be able to get you in a cart.

If you have high visibility safety vests, please bring them. Otherwise, I believe Jake from the Chamber of Commerce will have some available.

We will help with the line up as soon as deployed. The parade will roll at 10.

While the weather does not promise to be near 100 as usual, do bring a big hat and long sleeves. There should be water available from the Chamber of Commerce. As far as the heat is concerned, we will be complete by about 11AM before the worst part of the day.

We welcome the participation of CTARC members who make a valuable contribution to several of our outings. Please post this to any CTARC reflectors.

We some of our key people out this year, so your participation will be especially critical.

Thanks in advance for your help and see you Saturday 73 - Darwin K5DOA

Darwin,

I will be there again this year as it is Radio Club's turn. I alternate each year from participating in the parade on the Marine Corps League float and working with the radio club the following year. I will definitely need a golf cart in order to get around. The last time I did this, I was the "Water Boy" for the other radio club members working the parade. I can certainly do this again if you need it. Otherwise, just put me where you need me. Elizabeth may come as well to assist.

Take care and we'll see you in the morning.

Mike Sherrod

If you are curious where all of this history came from here is what happened. Years ago we had an estate sale at Lyons park. As I walked by the dumpster I noticed that many items were being thrown away. It appeared to me that many of them were useful so I recovered them. It also appeared to be a large part of TARC''s history. Later on I turned all of the historical items over to the club.

5888. Back on the Air after a Pause due to move!

Yahoo group: Temple_ARC
Date: 2015-08-24 05:44:22 UTC
From: n5mdvcolorado@...
Topic: 5888 Message: 5888

Hi all,

Frank here N5MDV for those who remember me.... I am back on the Air on HF... I sold my rig in anticipation of finally buying a house here in the Denver Area.

I now have a TS850SAT and working of of a Hybrid G5RV I put together seems to be working well and now I have a Huge Yard.... NO HOA and plenty of Room for antenna or Tower.... HIHI!

Hope all of you old timers are well.... I haven't heard from many in a while... I know we have lost a lot of us and sadly that will continue as we get older.... I am now 63 was in my 30s when I started as member of TARC and I miss all the group there.

I have not gotten active with a Club here ... now that I am able to get on the air more reliably I will find one and get active again.

I have a Facebook Page if anyone wants to stay in contact that way....https://www.facebook.com/N5MDV?ref=bookmarks

Hope all of you are well.... 73's Frank N5MDV

5889. Teacher from Scott Elementary in Temple looking for someone to come by and explain/demo Morse code

Message: I teach fifth grade at Scott Elementary in Temple and my students

are fascinated by Morse Code. It came up in conversation as we talked about ways we communicate - I know very little about it so we have been researching it. Is there anyone who might have equipment they could show us regarding morse code and be able to come talk to my students?

Please get in touch with me and I'll get you the specifics.

5890. Re: Teacher from Scott Elementary in Temple looking for someone to come by and explain/demo Morse code

From: Bob Schwartz
Topic: 5889 Message: 5890

I have been in ham radio for 60 years on and off. I never did anything except morse code.

I have a very nice collection of morse code telegraph keys and instruments which I have shown to the club a couple of times.

This response is to the teacher and to all club members. I would be very happy to put on a show. Silent key N5EL made several presentations to classes with help of another ham whose identity I do not know. From what Floyd told me, the students were facinated with a live code demonstration.

So, I am interested in helping.

Teacher and hams: anyone interested?

All,

This is a reminder of the HamEXPO breakfast for all TARC members and local VEs. Breakfast will be at 9 am this Saturday, 10 October, at the Golden Corral on I35 North of the Midway Drive in Temple.

Please be on time. I will be near the entrance till 9:10 with tickets to cover the cost of your breakfast. I believe we will be in the right rear of the restaurant.

Myron and I appreciate all the hard work to make the Fall 2015 HamEXPO one of the better ones we have held. Very few problems and a number of compliments on how well run HamEXPO was from attendees on the way our the door. Thank you for your time and work to make HamEXPO the great hamfest that it has become.

Jan. Please forward this Email to the VEs.

See you Saturday!

Over the past several months I have had to replace or upgrade five of my computers. I lost a lot of my email lists and photographs… Many hours later I am approaching my previous status on new and faster computers and programs. Perhaps my biggest project, other than the photographs, was rebuilding my weather event lists. This is the first time I have used it and I hope I added everyone.

I blind copy so that spammers cannot get your email address from my email.

Please make note if you received this note. I am going to send out a couple of messages, probably tomorrow, that will go to all of the entries on my amateur radio and Texas Master Naturalists' lists so that other people can opt in if they want to receive my weather emails.

Here is the latest take from EWX, the NWS for Austin/San Antonio.

Sent: Thursday, November 05, 2015 5:16 AM
To: undisclosed-recipients:
Subject: Heavy Rainfall and Possible Severe Storms Today Through Friday Morning

Good Morning South-Central Texas Partners,

Headline:

Flash flooding and severe storm threats will increase this morning and persist through Friday morning for much of South Central Texas.

Area of Concern:

Through This Afternoon:

Areas along and WEST of the I35 corridor including Austin and San Antonio metro areas.

(A Flash Flood Watch is in effect through 9AM Friday [see graphic below])

For Late Tonight through Friday Morning:

Areas along and EAST of the I35 corridor, still including Austin and San Antonio metro areas.

Threats & Impacts:

Rainfall amounts of 2-4 inches with isolated amounts as high as 6 inches through this afternoon for counties in the Red outlined area below (see attached graphic). These amounts could lead to localized flash flooding, especially where soil moisture is high from previous rainfall events. Also, these heavy rains may fall into already very saturated basins. The runoff from these basins could result in rapid river rises to already elevated rivers. Any recreational activities along and near flashy rivers and streams should be discouraged.

Timing and Overview:

An upper level system will interact with rich Gulf and Pacific moisture to produce a threat for flash flooding and severe weather. As this system progresses through Thursday, the heavy rain threat will focus on the I-35 corridor including the Austin and San Antonio areas. Also, a slight risk for severe thunderstorms will be possible this afternoon extending from the plateau north and east including the Hill Country and Austin area.

By late Thursday night, another round of thunderstorms will be associated with a cold front passage from the west. These thunderstorms will likely develop into a line and push southeastward across South Central Texas overnight Thursday into Friday morning. An additional 1-3 inches of rainfall with local amounts up to 5 inches will be possible with this line.

Confidence:

Flash Flooding: Moderate to High

Hail: Low

Damaging Winds: Low to Moderate

Tornado: Low

And here is the latest from Fort Worth/Dallas…

jbd/vex

From: Mark Fox - NOAA Federal [mailto:mark.fox@...]
Sent: Thursday, November 05, 2015 10:01 AM
To: undisclosed-recipients:
Subject: NWS UPDATE: Thursday Rainfall / Isolated Severe Risk

Good morning everyone,

Our next storm system is now exiting the Rockies, and triggering showers and thunderstorms over portions of North and Central Texas. Nearly all of our forecast area will experience another round of rainfall between now and 6 am Friday morning. We still expect a relatively fast moving system, which will help limit overall rainfall totals. However, moisture remains extremely plentiful - both in the atmosphere and on the ground. As such, it will take less rain to cause renewed flash flooding and river flooding problems in spots. We still have a low-end severe weather threat today and this evening, with strong winds being the main threat.

BOTTOM LINE:

Showers and thunderstorms will continue to develop over North and Central Texas this morning, continue through the afternoon and evening hours, and end from west to east early Friday morning. The system WILL be faster, and widespread totals will NOT be as great as previous events. Most locations should receive only 1 to 2 inches. However, rainfall intensities with some of the storms will be significant, and some isolated rainfall totals of 3-4 inches may occur in narrow bands. If these brief, yet intense thunderstorms line up in areas that have previously received heavy rains, then new flash flood problems ARE going to develop.

First responders and government officials throughout North and Central Texas, but particularly in areas east of a line from Paris to Waxahatchie to Lampasas need to be ready for the possibility of brief heavy rainfall rates from now through early tomorrow morning that may lead to new flooding problems.

In addition to the flash flooding threat, there is also a potential for strong to severe thunderstorms - particularly during the late afternoon through late evening hours. There is a small threat of damaging winds and large hail. Lightning, as usual, will remain a key concern for any outdoor activities later Thursday and Thursday evening.

AREAS /TIMING:

Most of the rain through mid afternoon will remain confined to areas along and east of Interstate 35. A few of these storms may produce brief heavy rain, though flooding threats are not considered likely. By mid afternoon, additional bands of showers and thunderstorms

will develop farther west, and will track north and east across most of North and Central Texas. By evening, most of rain should consolidate into one or two broad southwest-northeast oriented bands that will subsequently slide eastward overnight.

While these bands should move eastward steadily later today and this evening, individual cells may train over the same areas, and the rain intensities may be significant. A few spots may pick up 1 to 2 inches in short order. Flash flood problems would then follow in those areas where soils are already saturated. Right now, we're more confident that the heavier rainfall amounts (up to 4" in spots) will occur east of a Paris to Lampasas line. Isolated heavier totals are possible anywhere across North/Central Texas, however.

The best chance of any severe weather will be mainly from 4 pm through 10 pm. This threat will diminish from west to east as the evening wears on.

IMPACTS:

The biggest impact to prepare for is flash flooding - primarily in those areas east through south of the DFW Metroplex - where soils are quite wet. Elsewhere, a low-end flash flood threat also exists, particularly in urban areas this afternoon through late tonight.

The threat of severe thunderstorms, while low, IS present with this system. The main impact would be potentially damaging winds and large hail in a few spots. Given the degree of wind shear associated with this system, there is also a very small threat of a brief tornado or two. This threat will end from west to east Thursday evening.

CONFIDENCE AND ALTERNATE SCENARIOS:

We have high confidence that we'll see some locally heavy rain amounts across parts of North and Central Texas, but the overall amounts should not be as great as with previous events. We are ALSO confident that a few spots will experience brief, yet intense rainfall rates - which may yield isolated totals of up to 4 inches. Our confidence is pretty high that we'll see these heavier amounts somewhere east of a Paris to Lampasas line, which is unfortunately where preceding rains have been plentiful.

There is a small chance that the overall pace of the system may be a bit slower than we expect. If that occurs, then rainfall totals could be higher - perhaps yielding localized totals of 4 to 6 inches. This is not considered likely at this point.

Please don't hesitate to reach out to us via NWSChat, e-mail, or by phone if you have any questions or other specific needs.

Thanks,

Tom Bradshaw / Mark Fox

5902. FW: NWS UPDATE: Monday - Tuesday Severe Thunderstorms

Yahoo group: Temple_ARC
Date: 2015-11-16 15:24:12 UTC
From: Joe Dorn
Topic: 5902 Message: 5902
Attachments: 1 described; binary payloads are missing from this source WARC

I recently had to rebuild my weather notification list. I blind copy to prevent spam so if you think someone would like to be added, please forward to them and they can email me to be added.

This information is normally an email sent to me from the Austin/San Antonio and Fort Worth NWS offices… This is the foundation that the TV and other media outlets use to generate their hyped up forecasts…

FYI… I do not watch local TV stations for weather… I might add I do not watch local TV stations or the national network feeds period…. Too much desert, not enough main course.

From: Mark Fox - NOAA Federal [mailto:mark.fox@...]
Sent: Sunday, November 15, 2015 14:55
To: undisclosed-recipients:
Subject: NWS UPDATE: Monday - Tuesday Severe Thunderstorms

Good afternoon everyone,

Another in a series of vigorous upper level storms will move out of the Rocky Mountain states and into the southern plains tomorrow and Tuesday. This means more rainfall for north and central Texas, as well as the possibility for severe thunderstorms. There will be no shortage of available moisture, lift, instability, and wind shear to produce severe thunderstorms and localized heavy rain. A short pdf has been attached to graphically highlight areas and the associated risks.

BOTTOM LINE:

The ingredients will be in place for strong to severe thunderstorms across the region, especially during the overnight hours of Monday night / early Tuesday. Get some rest tonight, because several of us will be awake most of the night on Monday. Showers and a few thunderstorms will be in the area before Monday night, however, the strongest combination of ingredients will be in place during the overnight hours on Monday. Emergency managers, government officials should remain aware of the latest in the forecasts and current conditions on Monday and be prepared to take appropriate actions. We will be encouraging area media to remind people to have multiple ways to receive warnings in the middle of the night.

AREAS /TIMING:

Nearly all areas of north and central Texas will have a risk of severe weather Monday and Tuesday. The highest rainfall amounts will likely be to the east of the I-35 corridor.

Rain will begin spreading across parts of north and central Texas today, and will linger though Tuesday morning. Our primary concern will be the formation of strong to severe thunderstorms any time after Noon on Monday,with the greatest possibility of severe weather

occurring between 6 PM Monday and 6 AM Tuesday. This will not be a continuous event during this time, as it will likely be occurring in the form of multiple lines of storms.

IMPACTS:

Damaging winds, in excess of 60 mph will be the primary threat, followed by brief tornadoes, flash flooding, and large hail. The tornado threat will occur in two ways: in any discrete thunderstorms which can form ahead of a line of storms...or embedded, short lived tornadoes within the main squall line.

This system does not appear to be a prolific rainmaker for the area, yet as in most cases, there will be a few areas east of Interstate 35/35W which will have the potential to produce localized flooding.

CONFIDENCE AND ALTERNATE SCENARIOS:

We have relatively high confidence in the occurrence of strong to severe thunderstorms.

Please don't hesitate to reach out to us via NWSChat, e-mail, or by phone if you have any questions or other specific needs.

Thanks,

Mark

5903. FW: Strong to Severe Thunderstorms Expected Overnight Monday into Tuesday Morning

Yahoo group: Temple_ARC
Date: 2015-11-16 15:30:57 UTC
From: Joe Dorn
Topic: 5903 Message: 5903
Attachments: 2 described; binary payloads are missing from this source WARC

This is the Sunday (yesterday) edition of tonight and tomorrow from the EWX (Austin/SA) NWS office.

jbd/vex

From: Trevor.Boucher@... [mailto:Trevor.Boucher@...] On Behalf Of SR-EWX Alert - NOAA Service Account
Sent: Sunday, November 15, 2015 18:18
To: undisclosed-recipients:
Subject: Strong to Severe Thunderstorms Expected Overnight Monday into Tuesday Morning

Good Evening South-Central Texas Partners,

Headline:

Severe Thunderstorms will be possible beginning Monday night and lasting through Tuesday morning.

Area of Concern: (graphic attached)

All of South Central Texas excluding the Rio Grande Plains.

Threats & Impacts: (in order of significance)

Winds: The biggest concern with the highest confidence for this event. We should be receiving a mature, well-developed squall line which will be capable of straight line winds of 50-70 mph.

Tornadoes: There is a risk for tornadoes IF any isolated storms develop ahead of the line. Confidence is NOT high that we will see these isolated storms at this time. However, if we do, tornado development will be possible. The risk will be much lower with the squall line.

Lightning: The environment is favorable for significant lightning activity, especially with the squall line as it passes through. Expect frequent cloud to ground lightning strikes.

Hail: Large hail will be possible, both if we receive isolated storms ahead of the line and with the squall line itself. Quarter sized to ping pong ball sized hail will be possible.

Timing and Overview: (graphic attached)

A strong upper level storm system will begin to impact South Central Texas Monday night and persist through Tuesday morning. At this time, it appears likely that a strong to severe line of storms will begin to enter the Hill Country around midnight and push eastward towards the Austin area, reaching the I-35 corridor by around daybreak Tuesday morning. The line will be capable of producing severe straight line winds, large hail, and frequent

cloud to ground lightning.

There is also a possibility for isolated supercell storms to develop ahead of the line during the evening hours (6pm-midnight). While there is currently considerable uncertainty that this will occur, if these isolated cells develop, they will also have the potential for producing tornadoes. The area of concern for this isolated storm development is along the I-35 corridor and areas east.

Confidence:

Winds: Moderate to High

Tornadoes: Low (if isolated cells develop, then moderate)

Hail: Moderate

Lightning: Moderate to high

Joe,

How do I sign up for local weather alerts? I do not have a smart phone. Does that make a difference? I don't have a way to get notified if severe weather or a toronado comes my way. I can't get the weather radio Robert had to work. Where can I get another one?

Eula…

I have added you to my weather notification. I DO NOT give severe weather alerts in real time, we use the 145.31 repeater for that.

The information I send out is a 'Heads Up' notification from the National Weather Service, usually several hours to a couple of days before an event. This is intended to make the SKYWARN hams aware that something is in the air, literally…

The list is not restricted to hams and currently has over a hundred names on it. I will add people by email request only; this is so that I have a verified email address. I blind copy to prevent SPAM.

FWIW, this is the same information that the Emergency Responders, TV and other media outlets get. The media outlets then add their hype to it to fill time between commercials. I personally have not looked at local TV of any type in about ten years.

As to where you can find 'Weather Radios', HEB usually carries them in the early part of the year so that people can prepare for the tornado season. I believe that Academy carries them year round. Just be sure that it is a 'Midland' brand radio. Midland furnishes us several every year for the SKYWARN sessions.

I expect you can take the radio to one of the 'Coffee Shoppe' gatherings to get help with getting it programmed. It is a little tricky if you want to set it up for just the local advisories.

There is also a reverse 911 warning system, I forget its name, which is available in our area. The system sends out emails and makes telephone calls whenever a hazardous situation occurs.

BEWARE, it is a 24/7 system and I have received calls at all hours… It is a free service. I expect you can find to how to sign up from the Bell County Communications Center, local police or fire department.

I signed up at its inception a couple of years ago and have only received about five notifications. They were definitely needed.

I have copied my Weather lists since I have included some useful emergency information.

5908. FW:Parity Act Political Action Needed!

Yahoo group: Temple_ARC
Date: 2015-11-19 16:50:33 UTC
From: John Hobson
Topic: 5908 Message: 5908

I ask all local Hams, whether or not you are an ARRL member or not, to read the letter from David Woolweaver, K5RAV, ARRL West Gulf ARRL Division Director, and view the video noted below. It is important you contact Senator Ted Cruz's office requesting his support for Senate Bill 1685, the Amateur Radio Parity Act. The video will explain why this legislation is important to the Ham community.HOA restrictions may not effect you today but it might if you move to a new home in the future.

John WD5BFS

Taken from the West Gulf Division News Letter - 11.2015

ARRL President Kay Craigie, N3KN, has issued an urgent call for League Members to contact Senate Committee on Commerce, Science, and Transportation members representing their states to urge their support of Senate Bill 1685, the US Senate version of the Amateur Radio Parity Act of 2015. President Craigie said the bill could be scheduled for mark-up in the committee as early as next week, and that opponents to Senate Bill 1685 have been rallying their supporters. She said the ARRL and its legislative consultants on Capitol Hill "are hard at work" to ensure that the mark-up goes favorably. President Craigie called for "a blast of support for the bill" from ARRL members living in states that committee members represent.

(A mark-up is the process by which a U.S. congressional committee

debates, amends, and rewrites proposed legislation.)

"We learned this morning that opponents of the legislation have asked their people to contact Senators on the committee to communicate what can only be called bald-faced lies about the legislation's intent and effects," President Craigie said on November 11. "They are the same lies addressed in our video."

https://www.youtube.com/watch?v=AMY-5U1cJ6E

(This is a very nicely done video. I would recommend that you download and use it when you make one on one presentations. It supports both House Bill 1301 and Senate Bill 1685)

The ARRL also has written the committee to reiterate the reasons the legislation is needed and to contradict negative misinformation about its effects.

President Craigie said the message - by telephone or e-mail - is

simple: "I'm a constituent of Senator Cruz and an Amateur Radio

operator. I urge Senator Cruz to support Senate Bill 1685, the Amateur Radio Parity Act, when it comes up for a vote in committee. Thank you."

Senator Ted Cruz's contact information:

Washington, D.C. office

202-224-5922

404 Russell

Washington, DC 20510

"Whether ARRL members use e-mail or telephone, the essential thing is to do it now and to urge other hams in their states to do it now," President Craigie said.

(If you wish to send an E-Mail go to

http://www.cruz.senate.gov/?p=email_senator

My experience with E-Mail messages is that they are seldom read. In my opinion, it is best to call directly to the Washington office.)

Both Senate Bill 1685 and its US House twin, House Bill 1301, call on the FCC to extend the limited federal pre-emption of PRB-1 to cover private land-use restrictions such as deed covenants, conditions, and restrictions (CC&Rs). If the legislation becomes law, radio amateurs living in antenna-restricted communities would have the opportunity to negotiate with homeowners associations to install antennas that reasonably accommodate Amateur Radio communication.

Please call as soon as possible. The more calls that Senator Cruz

receives the more likely he is to support Senate Bill 1685 when it

comes before the Senate Committee on Commerce, Science, and

Transportation.

This special edition newsletter is going to Texas ARRL members only.

ARRL West Gulf Division

Director: David A Woolweaver, K5RAV

Topic: 5909 Message: 5909

World Radiocommunication Conference Approves Global 60 Meter Allocation!

<http://www.arrl.org/news/search/Tag.name:world%20radiocommunication%20conference>
11/18/2015

The Plenary Meeting of the 2015 World Radiocommunication Conference (WRC-15) in Geneva has approved an allocation of 5351.5-5366.5 kHz to the Amateur Service on a secondary basis with a power limit of 15 W effective isotropic radiated power (EIRP). The November 18 decision on Agenda Item 1.4 was adopted on two back-to-back readings. Some Region 2 countries, but not the US, will be permitted up to 25 W EIRP. With this action, and despite conditions that are more restrictive than had been hoped at the start of the Conference, the Amateur Service has obtained its first new global HF allocation since 1979. The new band will not become available until and unless the FCC adopts the Acts of the Conference and establishes operating rules. Until then, the five discrete channels will remain in place.

The International Amateur Radio Union (IARU) team in Geneva is now focusing its efforts on tweaking the agenda for WRC-19. It is likely, but not certain, that the agenda will include an effort to harmonize the Amateur Radio allocation at 50 MHz. A proposed agenda item to align the 160 meter allocation in Region 1 with the rest of the world is no longer under active consideration.

The WRC-19 agenda will also likely pose spectrum defense challenges, including the possible consideration of the 144 MHz and 430 MHz Amateur Radio allocations for sharing with the space operations service, and the possible consideration of one or more bands above 10 GHz for 5G smartphone use. The bounds of these potential defensive items, however, are still under discussion.

The IARU team continues to monitor several other WRC-15 items that appear to be headed toward acceptable conclusions. WRC-15 continues through the signing of the Final Acts on November 27.

Subject: NWS UPDATE: Thanksgiving Holiday Weekend Weather Update

Good morning and Happy Thanksgiving!

The rain event we have been advertising is set to begin today and tonight. Overall, the forecast is largely unchanged except there are some noteworthy changes to the forecast for today (Thanksgiving Day). It is possible a few strong or severe storms could occur today. In addition, some heavy rain may occur late today and tonight that could cause flooding. The rain will increase across the region today and continue through Sunday. A cold front on Friday will bring drastically colder temperatures for the weekend. Winter precipitation is NOT expected for our portion of the state, but heavy rainfall WILL occur. This will produce at least some flash flooding and river flooding through the weekend. Travel impacts on the ground and in the air are likely. A short PDF has been attached to better show precipitation amounts, timing, and impacts.

BOTTOM LINE:

Several rounds of rainfall will occur over North and Central Texas today through Sunday with a threat for flash flooding. Some heavy rain may occur late this afternoon through tonight and a few storms could possibly be strong or severe. An isolated brief tornado cannot be ruled out. The flooding threat will continue through Sunday when the rain will be gradually ending. The most likely locations that may experience flooding are in the Flash Flood Watch along and north of a line from Goldthwaite to Hillsboro to Athens. Within the Watch area, the highest rainfall totals are expected generally along and north of Interstate 30/20. Aside from potential impacts on streets/roads/interstates due to flooding, creeks and streams are likely to also be impacted by heavy rainfall. River rises are also possible through the weekend.

It is worth mentioning that some locations west of a line from Bowie to Comanche line may fall to 32 degrees late Friday night and early Saturday morning. We do NOT expect freezing rain to occur despite surface temperatures near freezing due to the shallow nature of the cold air and very warm raindrop temperatures.

Emergency managers, government officials and other first responders throughout North and Central Texas should remain abreast of the latest forecasts, and be prepared for possible severe storms today and flood impacts through the weekend. It is likely that extra staff may be necessary through the holiday weekend for public safety officials or public works.

LOCATIONS AND TIMING:

This afternoon and evening, there is the potential for a severe storm or two across North and Central Texas. The threat for severe storms today is low as the amount of instability is in question. If we had to narrow down an area of better potential for severe storm(s) it would likely be along and north of Interstate 20. If a severe storm develops, damaging winds would be the primary threat but an isolated brief tornado could also occur.

New model data suggests some heavy rain may occur this afternoon through tonight; mainly along and north of Interstate 30/20. This is earlier than the previous forecast, and the start time of the Flash Flood Watch has been changed to 6 pm tonight. The threat for heavy rainfall will continue Friday through Saturday Night as several rounds of rain impact the region. The rain will gradually end on Sunday. Our main concern for heavy rain - and flash flooding - will be from around 6 pm tonight through 6 am Sunday.

We're confident that all of North and Central Texas will receive rainfall. Rainfall amounts will range from around 2 inches in our southeastern counties to near 7 inches near the Red River. Our greatest confidence for heavy rain and potential flash flooding is generally along and North of Interstate 30/20. Amounts of 5 to 7 inches, with isolated higher amounts, are possible in these areas. Further, we think the very best chance for higher amounts will be in the first two tiers of counties along and near the Red River. However, the Flash Flood Watch extends outside of the previously mentioned areas and locations outside of these areas should also remain alert for at least some threat of flooding.

Impacts due to flooding may extend into Sunday when the rain finally ends and any standing water is allowed to finally start draining.

ALTERNATIVE SCENARIOS:

It is possible the axis of heavy rain could shift farther south. This would also shift the area of greatest flooding threat south which may also result in an expansion of the Flash Flood Watch.

If the rain stops long enough across our western counties Friday night and Saturday morning, it's possible some refreezing of water on elevated surfaces may occur but significant impacts to travel are not expected.

Please don't hesitate to reach out to us via NWSChat, e-mail, or by phone if you have any questions or other specific needs.

jbd/vex

From: Larry.Hopper@... [mailto:Larry.Hopper@...] On Behalf Of SR-EWX Alert - NOAA Service Account
Sent: Thursday, November 26, 2015 15:00
To: Larry Hopper - NOAA Federal <Larry.Hopper@noaa.gov>
Subject: Locally Heavy Rainfall Most Likely Friday Along and West of I-35...Rain Showers Likely Through Sunday

Good afternoon South-Central Texas Partners,

Headline:

...Locally Heavy Rainfall and Thunderstorms Most Likely Friday Along and West of I-35...

...Rain Showers Likely Through Sunday...

Timing and Area of Concern:

* Friday between 9 AM and Midnight for heaviest rainfall with storms ahead of and along the cold front.
* The most favored areas of heavy rainfall are along and west of I-35 (including the Austin and San Antonio metro areas), with the best chances in the Edwards Plateau and Hill Country regions. A Flash Flood Watch is not expected at this time.
* Widespread moderate rain showers will continue through Sunday Afternoon.

Rainfall Threats and Impacts:

* 1 to 3 inches on average, with isolated pockets up to 4 inches through Sunday (see attached graphic).
* Very localized flash flooding is possible, particularly with showers and thunderstorms along a cold front on Friday.
* Brief road closures and travel disruptions are possible.
* Severe thunderstorms are not expected at this time.

Overview:

Scattered to widespread showers and very isolated thunderstorms will continue today and tonight as temperatures remain very mild in the upper 60s and 70s. More numerous showers and thunderstorms are expected to move into the western Hill Country and Edwards Plateau regions on Friday morning before moving into the I-35 corridor during the afternoon and clearing our coastal plains late Friday evening. This front will move slow enough to cause a threat for very localized heavy rainfall capable of producing flash flooding mainly from late Friday morning through Friday evening with the stronger storms along the cold front as

it interacts with very high moisture values for late November. Saturday and Sunday will be cold generally in the 40s with moderate rain showers continuing as moisture from Hurricane Sandra in the Pacific moves in behind the front before rain chances dramatically decrease by Sunday evening.

Models continue to keeping the bulk of the heaviest rainfall just north of our county warning area as that is where the moist tap from Hurricane Sandra in the Pacific and stronger forcing along the front are most likely to enhance rainfall. However, the axis of moisture is slightly further south than previous runs, so shifts in the timing of the front and placement of tropical moisture could cause additional changes to the forecast.

Confidence:

* Timing of Heaviest Rainfall: High

* Rainfall Amounts: Moderate

Sincerely,

Larry Hopper, Nick Hampshire, and Aaron Treadway

5914. FYI... Rain reporting locations in the FWD CWA (County Warning Area) for the past 72 hours

Yahoo group: Temple_ARC
Date: 2015-11-30 22:54:53 UTC
From: Joe Dorn
Topic: 5914 Message: 5914

This URL just came across the NWS Fort Worth Chat Room. It is a summation of the rain reporting locations in the FWD CWA (County Warning Area) for the past 72 hours. Some areas had rain prior to this for the entire event period and the readings are a little low.

For once I am glad to be in the low precipitation area.

We have 5 acres fenced off for a yard and it is one big 'Mush Meadow'.

Looking for volunteers.

Monday December 7th.
Staging starts at 4:00 PM
Parade starts at 6:30 PM
Staging area should be clear by 7:30 PM.

Meet beginning at 3:30 PM behind the Bell County Health building at 201 N 8th (old school building).
Please see attached instructions and map. Print and bring with you if you can. I will have extra copies.
Please read beforehand if you can. I will go over the key points of the instructions on Monday.

On the map, the Blue circled numbers are locations that MUST be manned. Between TARC and the Red Carpet Ambassadors we need at least two people at the Blue intersections. The Red numbers are locations for traffic control that would be nice to man but not a necessity. If there is a Blue intersection you know you want to work let me know. I will try to accommodate.

Early forecast for Monday is sunny with a high near 60. Check forecast on Monday and please dress for the weather. Bring 2 meter HT if you have one, safety vest, flashlight, any snacks or drink you may want and perhaps a clipboard and pen. You should be able to park on the side avenue of your intersection.

If you have questions email me at meseckem@vvm.com

From: Tom Bradshaw - NOAA Federal [mailto:tom.bradshaw@...]
Sent: Friday, December 11, 2015 15:11
To: undisclosed-recipients:
Subject: NWS Fort Worth Update: Severe Weather/Flooding Potential Saturday-Sunday

Good afternoon partners,

A strong upper level storm system currently over the Southwest U.S and an approaching cold front will affect North and Central Texas Saturday and early Sunday, producing another good opportunity for rainfall - and a marked temperature change. We are not expecting a high end severe weather OR flash flooding event, but there will be some potential for strong to severe thunderstorms - and localized periods of heavy rainfall - with this system this weekend. A set of graphics is attached to this email for additional guidance.

BOTTOM LINE: Showers and thunderstorms will develop and move north or northeastward across North and Central Texas beginning late tonight through Saturday. It will not rain continuously everywhere throughout this period. The showers and thunderstorms will likely become more widespread late Saturday evening and through the overnight hours.

There will be a threat for severe storms mainly Saturday evening into the overnight hours, but an isolated severe storm cannot be ruled out during the afternoon hours. Severe storms with a threat for damaging winds and isolated tornadoes may develop west of I-35 Saturday evening ahead of a squall line. In addition, a limited threat for damaging wind and isolated tornadoes may occur along the squall line itself as it moves west to east across most of North and Central Texas late Saturday night/early Sunday morning.

A fast movement of the storms Saturday through Sunday morning should limit widespread flooding rains, but some locations along and east of Interstate 35 may pick up 2-3+ inches though early Sunday morning. With the ground remaining quite moist, this will create the potential for renewed small stream flash flooding and river flooding. All the thunderstorms - and the impacts they create - should be out of North Central Texas by mid-morning on Sunday.

We're not expecting a major severe weather outbreak of the type you can expect in the spring months. We're also not expecting a major flooding event either. However, everyone needs to remain alert for the adverse weather Saturday through Sunday morning.

KEY IMPACTS: Cloud to ground lightning will be a significant threat with this event. With ample wind shear and low level instability, rotating thunderstorms will produce a small opportunity for rapidly developing, brief tornadoes, as well as damaging downburst winds. Isolated flash flooding will also be a concern along selected basins and river reaches east

of Interstate 35.

LOCATIONS, AMOUNTS, AND TIMING: Rain amounts are expected to be around 1 inch or less west of I-35, and 1 to 3+ inches along and east of I-35. The highest rainfall amounts are expected in our far southeastern counties (Henderson, Anderson, Leon and vicinity). As always, a few spots will see totals in excess of these amounts, with much of it falling within a span of just a few hours. The main window for locally heavy rainfall will be from 4 pm Saturday through 8 am Sunday morning.

The greater potential for severe weather will occur Saturday evening with storms that develop ahead of the overnight squall line, mainly west of Interstate 35. Damaging downburst winds and isolated tornadoes will be possible.

The squall line is expected to develop around midnight across our western counties. We expect a limited threat for damaging winds as the squall line moves west to east across the region. Brief, rapidly developing tornadoes, while unlikely, also cannot be ruled out. By 8 am Sunday morning, we expect the squall line will have moved east of our forecast area.

For those planning outdoor activities sensitive to lightning and/or significant precipitation, there will be a good chance of both impacts Saturday afternoon and evening. It will not rain continuously throughout this period, however. Unfortunately, it is still difficult to pinpoint the exact timing and location of the rains.

CONFIDENCE: Confidence in the general location and timing of the impacts is MODERATELY HIGH at this point. Confidence in the rainfall amounts is also MODERATELY HIGH. There is some chance we'll have to increase the forecast amounts if we see signs that the system is slowing down, or additional moisture is ingested into the system from the Gulf. This does not appear likely now, but would obviously increase the potential for localized flash flooding or river flooding. Our confidence in the development of any severe weather is LOW to MODERATE at this point as persistent cloud cover on Saturday could limit the about of instability available for severe storm development.

ADDITIONAL MENTION: Over the past few days we have heard some speculation about a potential winter weather event next week. As of now, we are not expectingany winter weather next week. A strong cold front will arrive around the middle of the week but it looks like there is very limited moisture to produce any wintry precipitation. We of course will continue to keep a close eye on this system for any changes.

Emergency management, government officials, media, and other core emergency response partners will need to monitor forecasts and other updates concerning this weekend event. In the meantime, please don't hesitate to contact us if you have any questions or concerns.

Thanks,

Tom Bradshaw

Nothing really exciting in this note from Fort Worth, Yes, no white Christmas as usual. (I wonder if anyone on my lists has ever seen a white Christmas in Texas.)

I am passing it on because of the high travel rates over the next several days…

jbd/vex

From: Mark Fox - NOAA Federal [mailto:mark.fox@...]
Sent: Monday, December 21, 2015 12:16
To: undisclosed-recipients:
Subject: NWS UPDATE: Tuesday Night Thunderstorms / Weekend Outlook

Good afternoon.

Last week was relatively quiet, weather wise, but this week will be a bit more active. Thunderstorms are possible late Tuesday and early Wednesday, but are by no means guaranteed. A stronger storm system will begin to affect the area between Christmas Day and New Years. A short PDF has been attached to show the areas depicted and additional details.

BOTTOM LINE: Emergency management, government officials, media, and other core emergency response partners will need to monitor forecasts and other updates concerning late night/early morning thunderstorms Tuesday/Wednesday, as well as the potential for additional storms over the next weekend. There is a risk of severe thunderstorms, mainly to the east of I-35/35E late Tuesday into early Wednesday. Keep an eye on the weekend forecast as well. The next storm system will begin to affect the area on Sunday (27th) to Tuesday, Rain is expected for North and Central Texas at this time.

IMPACTS: For Tuesday, severe thunderstorms could produce winds in excess of 60 mph, hail to the size of quarters to half dollars, and isolated tornadoes. Supercell thunderstorms, and the higher potential for tornadoes will occur where and if thunderstorms become isolated. For this round of thunderstorms, heavy rain and flash flooding are not the primary impacts. Any water issues would be dependent on the exact location of brief downpours.

LOCATIONS, AMOUNTS, AND TIMING: Most areas will not see severe thunderstorms. Those that do will most likely be east of the Interstate 35/35E corridor. Thunderstorms are possible during the late afternoon or evening on Tuesday, but will be most likely between 8 PM and 5 AM Tuesday/Wednesday. It will not rain continuously this entire time, however.

CONFIDENCE: Confidence is low to moderate about the occurrence for severe thunderstorms Tuesday night and Wednesday. Confidence is high that widespread rain will be less than one half inch and the higher amounts will be in the east.

ALTERNATE OUTCOMES: The biggest alternate outcome is that severe thunderstorms do not materialize. This is a low possibility, due to the above normal moisture and temperatures.

WEEKEND OUTLOOK: Confidence remains high that we will see a stronger storm system move into Texas over the weekend. This storm system will be a bit stronger than the one on Tuesday

and will have the potential to bring rain and thunderstorms to North and Central Texas. As of this time (Monday), we expect the winter potential for this system to stay west and north of our area.

Please don't hesitate to contact us if you have any questions or concerns.

Thanks,

Mark

5918. FW: NWS UPDATE: Weekend Cornucopia of Weather

Yahoo group: Temple_ARC
Date: 2015-12-25 00:05:56 UTC
From: Joe Dorn
Topic: 5918 Message: 5918
Attachments: 1 described; binary payloads are missing from this source WARC

Enjoy springtime at Christmas, it ain't a'gonna last long… This is good or we will have peach trees blooming… Check the attached PDF file our and be sure you go to the end of them or you might not catch the Sunday events… It is best to have your traveling done by early Saturday afternoon…

The EWX version of this event will follow shortly…

Merry Christmas…

jbd/vex

From: Mark Fox - NOAA Federal [mailto:mark.fox@...]
Sent: Thursday, December 24, 2015 11:24
To: undisclosed-recipients:
Subject: NWS UPDATE: Weekend Cornucopia of Weather

Good evening

We continue to watch an approaching storm system that will produce rounds of rainfall, thunderstorms, and heavy rainfall over the weekend. This system is quite strong, and will likely end with the potential for light snow or a rain/snow mix before moving away from the area. A short PDF has been attached to show the areas depicted and additional details.

BOTTOM LINE: Emergency management, government officials, media, and other core emergency response partners will need to respond to several rounds of rainfall and possible flooding on Saturday and Sunday. As the system winds down on Monday, there will be the potential for snow or a rain/snow mixture late Sunday and early Monday morning.

IMPACTS:

Saturday: Strong or severe thunderstorms could bring urban and flash flooding for any area which receives more than 1/2 inch of rainfall. River flooding will also be a concern. Severe thunderstorms, if any, could produce wind gusts to near 60 mph and hail to the size of quarters and isolated tornadoes. In addition to these impacts, travel, especially air travel, will be delayed.

Note: The River forecasts, beginning Friday, will incorporate 48 hours worth of forecast rainfall; usually only 12 hours worth of rainfall are used. In general, runoff of more than 3 inches in the Lake Lewisville and Lake Grapevine basins could cause the lakes to rise to the spillways. We remain in close contact with the WGRFC and will monitor this closely.

Sunday: Urban, flash, and River Flooding possible through the day and evening. Travel could be delayed due to additional rainfall, as well as from storms from other areas.

Sunday Night and Monday: Frozen precipitation, likely in the form of snow or a rain/snow mixture is possible. Slick roads, and especially slick bridges and overpasses are possible.

Main thing about the impacts: Flooding will likely be the bigger impact than impacts from frozen precipitation.

LOCATIONS, AMOUNTS, AND TIMING: Please see the attachment for details. In general, the potential for heavy rainfall is highest east of line from Bowie to Palestine on Saturday and Sunday. The potential for snow or rain/snow mix is highest west of a line from Lampasas to Sherman late Sunday and early Monday

CONFIDENCE: Confidence is increasing that this storm will have several impacts on North and Central Texas. Confidence is highest in the potential for rain and heavy rain, and is lowest for the potential for snow or the rain/snow mix.

ALTERNATE OUTCOMES: Several.This system is similar to the Christmas Eve storm of 2009, which brought thunderstorms, followed by wintry precipitation. However, there are many differences from that storm, which brought more snow that we are expecting now.

Is rain guaranteed: Yes. As much as we meteorologists can guarantee ;-)

Is snow guaranteed: No.

Is flooding guaranteed? If so, where? Likely yes. Flooding will be possible for anywhere that receives over one half inch of rain in any one day. Most areas have forecast amounts at least this high. The highest potential for flooding and/or flash flooding will be in Fannin, Hunt, Hopkins, Delta, and Lamar Counties.

So if I am not in these counties, I'm fine? No. The risk is just higher in those counties.

Will there be severe weather? Possible in some areas, especially on Saturday.

Will there be tornadoes? Possible, especially Saturday.

When will you send out another email update? You're asking again? We will update through email after 3 PM on Christmas Day.

Please don't hesitate to contact us if you have any questions or concerns.

Thanks,

Mark

Here is the EWX (Austin/San Antonio NWS) version of the week end…

…and a Happy New Year

jbd/vex

From: Jason.Runyen@... [mailto:Jason.Runyen@...] On Behalf Of SR-EWX Alert - NOAA Service Account
Sent: Thursday, December 24, 2015 11:02
To: undisclosed-recipients:
Subject: Severe Storm Threat Sat Night & Hill Country Snow Possible Sun Night

Headline:

...Risk of Severe Thunderstorms Saturday Night into Sunday Morning...

...Light Snow Possible Sunday Night into Early Monday Morning across Northwest Hill Country...

Timing and Area of Concern:

* Saturday Night into Sunday Morning - All of South Central Texas has the potential for strong to severe thunderstorms (including the Austin and San Antonio metro areas).

* Sunday Night - Northwest Hill Country could see change over to snow.

Severe Storm and Rainfall Threats and Impacts across All of South-Central Texas:

* Damaging winds of 60-70 mph could interrupt power services and cause trees and branches to fall.

* Hail up to the size of quarters.

* An isolated tornado or two possible.

* Rainfall amounts will average 1 to 2 inches, with isolated pockets up to 3 inches, along and north of I-10. Amounts less than 1./2 inch closer to Rio Grande.

Winter Precipitation Threats and Impacts across Northwest Hill Country:

* Up to 1/2 inch of snow accumulating mainly on grassy areas, bridges, and other elevated surfaces.

Overview:

A very strong upper low will bring a potential line of strong to severe storms to South-Central Texas Saturday night through Sunday morning. The line of storms and cold

front will likely move through after midnight into Sunday morning, but there is a low chance of Saturday afternoon and evening storms ahead of the main line. These storms could be severe as well if they were to occur. Quickly dropping temperatures are expected once the front pushes through the area Sunday morning.

In addition, models have trended colder and slower with precipitation ending behind the front Sunday afternoon and night. There is now a potential to see a change over to snow across portions of the northwest Hill Country Sunday night, north of a Comstock to Kerrville line (see attached map). Confidence in this occurring is currently low, as there are some model differences with handling of the details of the upper level low. Should the change over to snow occur, accumulating snow at this time looks to be mainly on elevated surfaces, bridges and grassy areas, as ground and main roadway temperatures are relatively warm. Up to 1/2 inch of snow is currently forecast.

Farther to the north, anyone travelling across West Texas or the Panhandle will likely see travel disruptions due to snow Sunday into Monday.

Stay tuned as forecast in the severe potential and winter weather becomes clearer.

Confidence:

* Strong to severe storms: Moderate to High

* Rainfall Amounts: Moderate to High

* Snowfall: Low

Sincerely,

Jason Runyen

There is mention about some solid precip in this note…Don't hold your breath in my part of Central Texas…

I will be monitoring the 147.14 for any weather events…

The 147.14 covers our area of concern better than the 145.31…

Subject: NWS UPDATE: Ho Ho Ho...oh no, a Weather Update

Good evening

We continue to watch an approaching storm system that will produce rounds of heavy rain and severe thunderstorms over the weekend. This system is quite strong, and will end with the potential for light snow or a rain/snow mix before moving away from the area. A short PDF has been attached to show the areas depicted and additional details.

BOTTOM LINE: Emergency management, government officials, media, and other core emergency response partners should finalize preparations to respond to several rounds of rainfall and possible flooding on Saturday and Sunday. As the system winds down, there will be the potential for snow or a rain/snow mixture late Sunday and early Monday morning.

IMPACTS:

Saturday: Strong or severe thunderstorms could bring urban and flash flooding for any area which receives more than 1/2 inch of rainfall. River flooding will also be a concern. Severe thunderstorms, could produce wind gusts to near 60 mph and hail to the size of quarters and tornadoes. In addition to these impacts, travel, especially air travel, will be delayed due to thunderstorms and/or ground stops due to lightning.

Note: The River forecasts are now incorporating 48 hours worth of forecast rainfall; usually only 12 hours worth of rainfall are used. In general, runoff of more than 3 inches in the Lake Lewisville and Lake Grapevine basins could cause the lakes to rise to the spillways. We remain in close contact with the WGRFC and will monitor this closely.

Sunday: Urban, flash, and River Flooding likely through the day and evening. Severe Thunderstorms will be possible, including the potential for damaging winds and tornadoes. Travel could be delayed due to additional rainfall, as well as from storms from other areas.

Sunday Night and Monday: Frozen precipitation, likely in the form of snow, a rain/snow mixture, or freezing drizzle, is possible. Slick roads, especially slick bridges and overpasses are possible.

Main thing about the impacts: Flooding will likely be the bigger impact than impacts from frozen precipitation for most areas.

LOCATIONS, AMOUNTS, AND TIMING: Please see the attachment for details. In general, the potential for heavy rainfall is highest east of line from Bowie to Palestine on Saturday and Sunday. The potential for snow or rain/snow mix is highest west of a line from Lampasas to Sherman late Sunday and early Monday. The highest potential for accumulating snow will be to the west of a line from Comanche to Bowie. This includes the I-20 corridor and Ranger Hill.

Severe thunderstorms are possible on Saturday from the mid morning through the early evening hours. On Sunday, severe thunderstorms are possible from mid morning through late afternoon. Frozen precipitation will be possible from 6 PM Sunday through Noon Monday.

CONFIDENCE: Confidence remains high that this storm will have several impacts on North and Central Texas. Confidence is highest in the potential for rain and heavy rain, and is lowest for the potential for snow or the rain/snow mix.

ALTERNATE OUTCOMES: Several.This system is similar to the Christmas Eve storm of 2009, which brought thunderstorms, followed by wintry precipitation. However, there are many differences from that storm, which brought more snow that we are expecting now.

Is rain guaranteed: Yes. As much as we meteorologists can guarantee ;-)

Is snow guaranteed: No.

Is flooding guaranteed? If so, where? Likely yes. Flooding will be possible for anywhere that receives over one half inch of rain in any one day. Most areas have forecast amounts at least this high. The highest potential for flooding and/or flash flooding will be in Fannin, Hunt, Hopkins, Delta, and Lamar Counties.

So if I am not in these counties, I'm fine? No. The risk is just higher in those counties.

Will there be severe weather? Possible in some areas, especially on Saturday.

Will there be tornadoes? Possible, especially Saturday. Depending on where the front stalls, there will be the potential on Sunday as well.

When will you send out another email update? We will send another update late in the day on Saturday.

Please don't hesitate to contact us if you have any questions or concerns.

Thanks,

Mark

5921. FW: Severe Storm Threat This Evening into early Sunday

Yahoo group: Temple_ARC
Date: 2015-12-26 17:06:02 UTC
From: Joe Dorn
Topic: 5921 Message: 5921
Attachments: 1 described; binary payloads are missing from this source WARC

This is the latest from EWX… I have not heard from FTW today except in the chat room… here is an excerpt:

(12/26/2015 09:01:19) nws-dennis.cavanaugh: The risk of severe weather today is pretty much active/possible all day. Our 12Z sounding did have a cap in place... but it's weak. The environment is supportive of supercells capable of producing tornadoes. The main missing ingredient is lift/a focusing mechanism for convection. IF any storms develop in the warm sector, they will likely become severe quickly and pose a tornado threat. The challenge will be getting storms to develop in the warm sector. We'll be watching closely. If storms start to develop, expect a red box fairly quickly from us/SPC. Clouds will inhibit warming today... but not prevent it. As a result, severe storms are a bit more likely this afternoon.
(12/26/2015 09:08:12) media-brian.james: Thanks for the update, Dennis. Days like this make me nervous. I sure hope people are paying attention.
(12/26/2015 09:08:19) media-brad.barton: Good briefing, Dennis. Thanks much.
(12/26/2015 09:16:58) nws-dennis.cavanaugh: No problem! The best thing we have going for us is that we just may not have the lift to get storms going in the warm sector today. If we do though... yeah, it could get ugly quick. If it looks like something is changing rapidly in the short term, we'll let you know ASAP. If you all see something, let us know as well!

jbd/vex

From: paul.yura@... [mailto:paul.yura@...] On Behalf Of SR-EWX Alert - NOAA Service Account

To: Paul Yura - NOAA Federal <paul.yura@...>
Subject: Severe Storm Threat This Evening into early Sunday

Headline:

...Risk of Severe Thunderstorms This Evening into Sunday Morning...

Timing and Area of Concern:

* 6 PM - Midnight ....Isolated strong to severe thunderstorms possible across all of South Central Texas.

* Midnight - 7 AM Sunday...Widespread showers and thunderstorms, some storms may be severe, all of South Central Texas.

* 7 AM - Noon Sunday - Scattered showers and thunderstorms, mainly east of I-35.

Severe Storm and Rainfall Threats and Impacts across All of South-Central Texas:

* Damaging winds of 60-70 mph could interrupt power services and cause trees and branches to fall.

* Hail up to the size of quarters.

* An isolated tornado or two possible.

* Rainfall amounts will average 1 to 2 inches, with isolated pockets up to 3 inches, along and north of I-10. Amounts less than 1./2 inch closer to the Rio Grande.

* Localized ponding of water is possible. Flash Flood Threat is low. Highest rain totals will be in the northernmost areas of South Central Texas

Overview:

A very strong upper low will bring a potential line of strong to severe storms to South-Central Texas later tonight into Sunday morning. A few isolated showers and thunderstorms may form ahead of this main system late this afternoon and evening, but this activity should remain fairly isolated. Chances of showers and storms, some severe, will increase dramatically past midnight as a cold front approaches from the west. A line of storms is forecast to be near and along I-35 around 6 AM Sunday and continue to push east during Sunday AM. The main threat overnight will come from severe storms which may produce hail, strong damaging winds...even an isolated tornado is not out of the question. Rainfall totals of 1-2 inches are possible across the northern sections of South Central Texas but the overall flooding threat remains low.

Farther to the north, anyone travelling across West Texas or the Panhandle will likely see travel disruptions due to snow and blizzard conditions through the weekend. Check road conditions before you try to travel.

Confidence:

* Strong to severe storms: Moderate

* Rainfall Amounts: Moderate to High

Sincerely,

Paul Yura

From: paul.yura@noaa.gov [mailto:paul.yura@...] On Behalf Of SR-EWX Alert - NOAA Service Account
Sent: Sunday, December 27, 2015 07:35
To: undisclosed-recipients:
Subject: Severe Weather Threat Continues over the East through Sunday Morning.

South Central Texas Partners....

Headline:

...Risk of Severe Thunderstorms Through noon Sunday Across the Far East...

Timing and Area of Concern:

* 8 AM through Noon....Isolated strong to severe thunderstorms possible across the far eastern third of South Central Texas, mainly east of line from Georgetown to Cuero. Best chances across Lee, Fayette, and Lavaca Counties.

Severe Storm and Rainfall Threats and Impacts across eastern sections of South-Central Texas:

* Hail up to the size of quarters.

* Damaging winds of 50 to 60 mph could interrupt power services and cause trees and branches to fall.

* An isolated tornado or two is possible.

* Rainfall amounts will average 1 to 2 inches, with isolated pockets up to 3 inches, east of Highway 183.

* Localized ponding of water is possible. Flash Flood Threat is low.

Overview:

A cold front has pushed through the western half of South Central Texas Sunday morning. This front will continue to move east through the morning hours and help trigger showers and thunderstorms across the I-35 corridor and points east. The chance for severe storms is low along the I-35 corridor, but increases as you head east toward Houston. We expect showers and storms to continue forming ahead of the cold front bringing the best chances for severe storms later this morning across Lee, Fayette, and Lavaca Counties. Hail, damaging winds, and even an isolated tornado are possible. Rainfall totals of 1-2 inches

are possible across this threat area. During the afternoon hours, we expect the majority of the rainfall and severe threat to push out of our area and continue into East Texas.

Confidence:

* Strong to severe storms: Low to Moderate

* Rainfall Amounts: Moderate to High

Sincerely,

Paul Yura

Sunday Morning FWD update

jbd/vex

From: Tom Bradshaw - NOAA Federal [mailto:tom.bradshaw@...]
Sent: Sunday, December 27, 2015 08:01
To: undisclosed-recipients:
Subject: NWS Fort Worth Intermediate Update: Severe and Winter Storm Impacts

Good morning, everyone.

The major wintertime storm we've been expecting here in North Central Texas is now bearing down on us, full-on. We're about halfway through our sequence of impacts, with the second half facing us over the next 24 hours. This will be a short, intermediate update for now, with a more comprehensive brief planned for early afternoon.

BOTTOM LINE: Severe weather is still possible in our far eastern counties, but heavy rainfall and flooding will be the greatest threat from now through tonight. There will be at least a couple of additional rounds of rain for most areas. Winter weather - with some impacts to roads - is also a threat in our far western counties through tomorrow morning.

Emergency management, government officials, media, and other core emergency response partners: You'll need to stay alert for additional response activities through tomorrow morning.

IMPACTS:

Severe Thunderstorms. There remains a threat of severe thunderstorms in our far eastern counties this morning, with tornadoes and damaging winds possible. This threat will diminish later today as the cold front sweeps eastward through these areas.

Flooding. This is the primary threat. Heavy rainfall will occur in at least two waves along and east of the I-35 corridor. Additional rainfall amounts of 2-4 inches are possible, particularly east of I-35 and north of I-20 through tonight. Flash flooding AND river flooding will be a resultant threat.

Right now, we believe the initial round of heavy rainfall east of I-35 will slide eastward out of our area by mid/late morning. There may be a relative lull in rainfall over most of North and Central Texas through much of the day, followed by a second round of heavy rain, moving from west to east across the area this evening and overnight.

Snow/Sleet. As the upper level low pressure system wraps up and moves across North Texas tonight, colder air will move into our far western counties. A mixture of sleet and snow is possible west of a Goldthwaite to Mineral Wells to Gainesville line. This area may pick up anywhere from 1 to 3 inches of snow or sleet by daybreak Monday. This will produce some slick conditions on roads and bridges. I-20 at Ranger Hill could particularly experience

these conditions late tonight.

CONFIDENCE: Our confidence remains high on the occurrence of additional heavy rain along and east of I-35. Confidence is moderate about the formation of additional severe weather in our far eastern counties. Finally, we have only low to moderate confidence in the development of accumulating snow or sleet. Our main concern here is that the atmosphere may not get quite cold enough for sufficient amounts of snow to reach the surface and accumulate. We'll be taking a very hard look at the winter weather potential as we refine the forecast today.

We will send another update by early afternoon today. In the meantime, please don't hesitate to NWSChat us or call us if you have any questions or concerns.

Thanks,

Tom

jbd/vex

From: Mark Fox - NOAA Federal [mailto:mark.fox@noaa.gov]
Sent: Friday, January 15, 2016 13:27
To: undisclosed-recipients:
Subject: NWS UPDATE: Cold Rain / Mix Saturday.

Good afternoon,

We continue to forecast colder temperatures for the weekend, as well as a mixture of rain and snow. There are several social media images that can be seen which show accumulating snow in the areas north of I-20 to the Red River. In a nutshell, we are not expecting much (if any) accumulations across North Texas. Only rain is expected in Central Texas

BOTTOM LINE: Emergency managers and public safety officials may experience a mixture of rain and snow. However, any impacts are expected to be minimal, especially in the counties along the Red River

IMPACTS: A few unlucky folks may experience a three or four hour window of slushy side roads and/or bridges. Most areas will see temperatures above 35, even during times of any rain/snow mix.

LOCATIONS, AMOUNTS, AND TIMING: The rain and snow mixture is most likely between 9 AM and 3 PM Saturday. Please see the graphics on our web page to depict the latest thoughts.

CONFIDENCE: Confidence is high in the forecast of colder temperatures with precipitation. Most areas will warm into the upper 30s and low 40s for Saturday afternoon highs, increasing our confidence that any impacts would be minimal.

ALTERNATE OUTCOMES: The main alternate scenario concerns the depth of the cold air. Monitor the forecast if temperatures drop below 35 degrees overnight. (This is currently not forecast to occur)

Please don't hesitate to contact us if you have any questions or concerns.

Thanks,

Mark

South Central Texas Partners....

Headline:

...Risk of Severe Thunderstorms Through noon Sunday Across the Far East...

Timing and Area of Concern:

*8 AM through Noon....Isolated strong to severe thunderstorms possible across the far eastern third of South Central Texas, mainly east of line from Georgetown to Cuero. Best chances across Lee, Fayette, and Lavaca Counties.

Severe Storm and Rainfall Threats and Impacts across eastern sections of South-Central Texas:

*Hail up to the size of quarters.

*Damaging winds of 50 to 60 mph could interrupt power services and cause trees and branches to fall.

*An isolated tornado or two is possible.

*Rainfall amounts will average 1 to 2 inches, with isolated pockets up to 3 inches, east of Highway 183.

*Localized ponding of water is possible. Flash Flood Threat is low.

Overview:

A cold front has pushed through the western half of South Central Texas Sunday morning. This front will continue to move east through the morning hours and help trigger showers and thunderstorms across the I-35 corridor and points east. The chance for severe storms is low along the I-35 corridor, but increases as you head east toward Houston. We expect showers and storms to continue forming ahead of the cold front bringing the best chances for severe storms later this morning across Lee, Fayette, and Lavaca Counties. Hail, damaging winds, and even an isolated tornado are possible. Rainfall totals of 1-2 inches are possible across this threat area. During the afternoon hours, we expect the majority of the rainfall and severe threat to push out of our area and continue into East Texas.

Confidence:

*Strong to severe storms: Low to Moderate

*Rainfall Amounts: Moderate to High

Sincerely,

Paul Yura

The BCARC is having a presentation on Yaesu's System Fusion system given by Ceven K5ORN form the Johnson County Amateur Radio Club. Anyone interested in learning more about the system fusion repeaters and the Wires-X internet connection are invited to the BCARC meeting this Saturday Feb. 13 at 6:30 pm. The meeting place is at the Old City Hall in Valley Mills, Texas. The hall is located at the corner of HWY 6 and FM56. Those of you coming from the Temple/Belton area, just get on 317 and follow it to Valley Mills. Turn left on HWY 6 towards Clifton and go three blocks to 4th St. (FM56) and turn right. You will see the Old City Hall on your right. It is in front of the Fire dept. Please park in the vacant lot towards HW 6 or the lot to the left of the building. Hope to see and meet all of you. Drive safely! 73Don AI5AI

Sent: Tuesday, March 08, 2016 06:36
To: undisclosed-recipients:
Subject: Tuesday 8 March, 630 am: Severe Weather Outlook for Tonight

Good Morning South-Central Texas Partners,

Headline:

Strong to Severe Thunderstorms Expected This Evening into Early Wednesday

Area of Concern:

All of South Central Texas is at some risk for severe weather. However, the greatest threat area is near and southeast of an Austin to Boerne to Carizzo Springs line (see attached graphic), including San Antonio.

Threats & Impacts:

Those storms which become severe will be capable of the following:

Winds: Damaging winds of 60 to 70 mph

Hail: Up to golf ball-sized

Tornadoes: One or two tornadoes

Rainfall: Rainfall Today through Friday will range from 1 to 3 inches at many locations. An isolated pocket or two of up to 5 inches is possible across eastern counties, east of I-35. Isolated spots of flooding possible.

Timing and Overview:

Showers and isolated thunderstorms will exit the region later this morning, with a temporary lull in precipitation this afternoon. A strong upper low across northwest Mexico will move toward West Texas tonight. This low will interact with deepening moisture to produce widespread showers and thunderstorms. The showers and storms look to first develop near the Rio Grande and South Texas around 6-8 PM tonight, and expand into the I-35 corridor of South-Central Texas, and eastward, between 8 PM and midnight. Conditions will be favorable for some storms to become strong to severe. There is a chance the storms could organize into a squall line overnight, and push into Southeast Texas Wednesday morning.

Confidence:

Confidence in severe threat: Medium

Sincerely,

Jason Runyen

Subject: Weather Update...3 PM Tuesday March 8, Severe Weather Possible this Evening into the Overnight Hours...

Good Afternoon South-Central Texas Partners,

Headline:

Strong to Severe Thunderstorms Expected This Evening into Early Wednesday

Area of Concern:

All of South Central Texas is at some risk for severe weather. However, the greatest threat area (Enhanced Risk) is near and southeast of a Georgetown to Boerne to Carizzo Springs line (see attached graphic), including San Antonio and Austin.

Threats & Impacts:

Those storms which become severe will be capable of the following:

Winds: Damaging winds of 60 to 70 mph

Hail: Up to golf ball-sized

Tornadoes: One or two tornadoes

Rainfall: Rainfall this evening through Friday will range from 1 to 3 inches at many locations. An isolated pocket of higher totals up to 5 inches is possible across eastern counties, east of I-35. Isolated spots of flooding possible.

Timing and Overview:

A strong upper low across northwest Mexico will move toward West Texas tonight. This low will interact with deepening moisture to produce widespread showers and thunderstorms. The showers and storms are developing near the Rio Grande this afternoon and will expand eastward into the I-35 corridor of South-Central Texas likely between 8 PM and midnight. As these storms push east of Interstate 35 they will likely persist well past midnight into the early Wednesday morning hours. Our far eastern areas could see storm activity during

Wednesday morning commute times...5-7 AM. Conditions will be favorable for some storms to become strong to severe. There is a chance the storms could organize into a squall line overnight, and push into Southeast Texas Wednesday morning.

While Flooding will not be a major concern overnight due to the lack of rainfall so far in 2016, subsequent rain chances the rest of the week may bring higher chances of isolated flooding issues by mid to late week.

Confidence:

Confidence in severe threat: Medium

Sincerely,

Paul Yura

Subject: NWS UPDATE: Evening / Overnight Thunderstorms

Good evening everyone,

Yes, there is another round of rainfall which will be coming through overnight. There remain a few thunderstorms in Central Texas currently, with the next batch beginning to develop between San Angelo and Abilene.

Thunderstorms will increase in coverage and intensity near midnight, and will likely continue for much of the overnight hours and early Wednesday morning. The severe thunderstorm risk will not be as high as what we saw this morning, but there will be isolated areas which could see severe thunderstorms. Mainly, this will be another batch of rain and localized heavy rain.

Get some rest, because this system isn't quite done yet.

Mark

To: undisclosed-recipients:
Subject: NWS UPDATE: Severe Thunderstorm Potential - Wednesday

Good afternoon,

We continue to watch a storm system which will begin to affect areas of North and Central Texas tonight, before giving much of the area a chance for strong to severe thunderstorms Wednesday afternoon / evening. A short PDF has been attached to show the areas depicted and additional details.

BOTTOM LINE: Emergency management, government officials, media, and other core emergency response partners should be prepared for the potential for severe thunderstorms by Wednesday afternoon and evening. Continue to monitor NWS forecasts, graphics, and outlooks for further changes and/or refinements to the forecast. Thanks to the timing of the storms, there will be the potential for some severe thunderstorms to occur during school hours and/or school dismissal times. Organized spotter groups should be prepared for activation during daylight hours on Wednesday.

THREATS: Severe thunderstorms, including hail to the size of golf balls, damaging winds in excess of 60 mph, and tornadoes are all possible during the afternoon hours on Wednesday.

LOCATIONS, AMOUNTS, AND TIMING: Please see the attachment for further details / timing. In general, light rain will occur overnight, with strong thunderstorms developing in the west (along the dry line) in the early afternoon hours.

CONFIDENCE: Confidence is moderate to high in that parts of North / Central Texas will see severe thunderstorms on Wednesday. Confidence is high in the expected progression of starting in the northwest and moving east. Confidence is lowest in specific locations.

ALTERNATE OUTCOMES: The location of the dry line and front will have a significant impact of who gets severe weather, and when that happens.

Is rain guaranteed: No. Some areas will not receive any rainfall tomorrow.

Will there be severe weather? Likely. If your area gets a thunderstorm, there is a good chance the storms will be severe.

Will there be tornadoes? Possible, especially in any storm that is able to form by itself. The most likely time for this will be during the late afternoon hours on Wednesday.

Is this system the worst one since...? Not necessarily. This is a typical late March / early April system. One that will cause issues for someone.

When will you send out another email update? We will do our best to update everyone before Noon on Wednesday.

Please don't hesitate to contact us if you have any questions or concerns.

Additional Note: We discovered a sporadic issue with spotter notifications sometimes reaching incorrect counties. We have confirmed everyone is indeed in the correct groups (Counties). Thank you for being patient with us while we iron out all of the kinks.

Thanks,

Mark

Subject: NWS Update: Severe weather/excessive rainfall potential this weekend

Good afternoon everyone,

We're still several days out, but I did want to send a short heads-up concerning the potential for active weather later this weekend. We know this weekend is packed with a number of outdoor events across North Texas, and all of these will be weather-sensitive. A large, strong storm system will be approaching the Southern Plains by the weekend, and some rain and lightning IS possible Saturday. On Sunday, Thunderstorms are LIKELY, and both severe weather and heavy rainfall will be possible. The bottom line I want to stress is this: Start making some contingency plans now if your upcoming activities will be weather sensitive.

Here's an early outlook:

SATURDAY/SATURDAY NIGHT: Scattered showers and thunderstorms - more numerous west of I-35 later in the day. Lightning will be the primary threat.

SUNDAY/SUNDAY NIGHT: Showers and thunderstorms becoming numerous. We will have a some degree of potential for severe thunderstorms, accompanied by hail and wind, over our area - with central Texas looking most favorable at this time. Heavy rain - possibly on the order of several inches - will also be possible over our counties south of I-20 and west of I-45. Some flash flooding and mainstem river flooding issues may ensue in these areas.

Folks, we have a ways to go before we get this slow-moving system into our area. As a result, our confidence on impacts, locations and timing is not high right now. This will be our key forecast issue over the next 4 days, and we'll be resolving our uncertainties as we move forward. You can expect another update from us tomorrow (Thurs), accompanied by a graphics package. In the meantime, don't hesitate to chat us or send us an email if you have any immediate questions.

Thanks,

Tom

BCC: My VE List

As most of you were made aware, I have resumed responsibility for local amateur radio testing including the Ham Expo after Ross Greg was diagnosed with severe health problems. I had a prior commitment for the April Expo date and asked for a backup to oversee the testing. Kenneth, KE5ISN responded to the request and will be in charge of the testing. He will need strong VE support for the event.

PLEASE give him the support you folks have always given me.

Please join Kenneth on the second floor of the main Expo Building at 9:00 am to assist with setup, testing will begin at 9:30 and will continue until all folks that want to test have had their chance.

Please respond all if you can assist.

Show your VE badge for free admission to the TARC part of the event.

Sorry for the very late request but this spring has been extremely busy for me and I almost forgot about it.

From: Tom Bradshaw - NOAA Federal [mailto:tom.bradshaw@...]
Sent: Thursday, April 14, 2016 15:07
To: undisclosed-recipients:
Subject: NWS Update: Heavy rainfall/severe weather potential this weekend

Good afternoon everyone,

We still expect a big, strong, slow-moving upper level storm system to reach the Southern Rockies by Saturday, bringing widespread showers and thunderstorms to North and Central Texas in the late Saturday through Monday timeframe.

BOTTOM LINE: Flash flooding, mainstem river flooding and isolated severe thunderstorms are ALL possible Sunday and Monday, though our confidence in exact locations and amounts is NOT high at this time. EMs, government officials, media, and other core emergency response partners: Some degree of response will likely be required for hazardous weather Sunday and Monday. Also, contingency plans should be in place for any weather sensitive outdoor activities over the weekend (especially Sunday).

QUICK BREAKDOWN ON TIMING/THREATS:

SATURDAY/SATURDAY NIGHT: Not a washout, but not completely dry either! Scattered brief showers and thunderstorms - more numerous west of I-35 later in the day. Lightning will be the primary threat.

SUNDAY/SUNDAY NIGHT/MONDAY: Showers and thunderstorms becoming numerous area-wide after Noon Sunday, continuing into Monday.

Widespread amounts of 2-3 inches are possible across all of North and Central Texas through Monday. Within this broad region, there will be localized areas receiving amounts of 3 to 6 inches, and possibly more - especially Sunday night and Monday morning. Right now, we believe the broader I-35 corridor from DFW southward to Temple will be the focus area for this heavier rain and resultant flooding. However, we MUST STRESS that our confidence in the exact locations of heavy rainfall are NOT HIGH. All of North and Central Texas needs to be ready for localized flash flooding - and later, mainstem river flooding. If your jurisdiction is prone to flash flooding: you may have impacts Sunday/Monday.

We will also have some potential for severe thunderstorms over our area Sunday, with areas south of I-20 looking most favorable at this time. Right now, the risk does not appear to be great, but that could change with later forecasts. The threats with these severe storms, if they develop, would include hail, damaging wind, and tornadoes.

I stress that we still have a way to go before we get this slow-moving system into our area. As a result, our confidence on locations and timing is not high right now. We'll continue to resolve the various uncertainties as we move forward. We'll send another update tomorrow. Otherwise, don't hesitate to chat us or send us an email if you have any immediate questions.

Thanks,

Tom

Sent: Thursday, April 14, 2016 15:28
To: undisclosed-recipients:
Subject: Heavy Rainfall Possible Late Saturday into Tuesday Morning

Good evening South-Central Texas Partners,

Headline:

A slow-moving storm system may bring locally heavy rainfall to South Central Texas Late Saturday through Tuesday Morning

Area of Concern and Timing:

* Late Saturday through Sunday evening: Areas primarily along and west of I-35, including the Austin and San Antonio Metro Areas.
* Sunday evening through Tuesday morning: Areas primarily along and east of I-35, including the Austin and San Antonio Metro Areas, with threat gradually ending from west to east

Threats and Impacts:

Rainfall Amounts (see attached graphic):

* Widespread 2-4 inches with isolated 6-8 inch totals possible for areas east-northeast of a Kerrville to Hondo to Pleasanton to Cuero line.
* Lesser amounts of 1-2 inches with isolated 3-5 inches possible along the Rio Grande Plains and Edwards Plateau.

Severe Weather:

* Although it will be secondary to the heavy rainfall and flash flooding threat, isolated damaging winds and isolated brief tornadoes will be possible (hail threat low).

Overview (see attached graphic):

A slow-moving upper level low and cold front will bring an increasing chance of showers and thunderstorms on Saturday before becoming widespread for Sunday into Tuesday morning. Although it is currently too far out to pinpoint exact times and rainfall amounts, many model solutions indicate that at least two periods of heavy rainfall will be possible. The

first period will most likely be late Saturday into Sunday evening as storms move into the Rio Grande Plains and Edwards Plateau from the west, allowing heavy rainfall to set up over the Edwards Plateau, Hill Country, and possibly the I-35 corridor during the day on Sunday. Another impulse is expected late Sunday into Monday as a front and the heavy rainfall threat shift east into the I-35 corridor and Coastal Plains before gradually ending from west to east by Tuesday. Future model cycles should help refine the location and timing of heavy rainfall.

Confidence:

* Moderate to High on Heavy Rainfall Potential
* Low to Moderate for Rainfall Amounts and Impacts

As forecast confidence increases we will update you with specifics.

Sincerely,

Larry Hopper and Nick Hampshire

Subject: NWS Dallas/Fort Worth Update: Weekend/Early Week Flooding/Severe Weather Potential

Good afternoon everyone,

The big rainfall event for North and Central Texas that we've been discussing for the past several days is taking a bit better shape in our models today. ALL the ingredients we look for with excessive rainfall, including unusually high moisture content, instability, strong lift, and slow thunderstorm motions will converge over our region late this weekend. At the same time, the entire weekend will not be a washout. There will be widely scattered showers and thunderstorms Saturday afternoon - especially west of I-35 - but rainfall will be brief and not excessive for most of the area. (Please see the attached graphics for details.)

BOTTOM LINE: Flash flooding, river flooding and isolated severe thunderstorms are ALL expected to occur to varying degrees Saturday night through Tuesday morning. Not everyone will be hit equally with heavy rainfall, but at this point we're asking all of our core partners to be prepared for response activities. This could be an event where a few selected local jurisdictions are confronted with very significant flash flooding late Sunday/Sunday night, based on the signatures that we're seeing in the guidance.

This weekend is loaded with outdoor events across North and Central Texas. Contingency plans should be in place for any weather sensitive activities over the weekend (especially Sunday).

KEY THREATS: Flash flooding and river flooding. Storm total rainfall amounts of 2 to 4 inches are expected over nearly all of North and Central Texas, with locally higher amounts of 4 to 8 inches possible. Flash flooding will be a key threat, followed by river flooding

along many of the primary basins.

We will also have a limited severe weather threat, primarily Sunday. The main threat with any severe storms that do form would be brief tornadoes or damaging winds. Large hail is much less likely to be an issue with this event.

LOCATIONS/TIMING:

Flooding. The area of greatest concern for flash flooding is along and south of Interstate 20, particularly in those counties roughly bounded by I-35 and I-45. We may see some isolated heavy rainfall over our far western counties as early as 4 am Sunday. However, the time period of greatest flash flood threat will be after 4 pm Sundayafternoon, extending overnight Sunday night into midday Monday. We stress that our confidence in the timing and location of the heaviest rainfall is only moderate at this time. However, we do encourage jurisdictions to be especially prepared for the possibility of flash flood response activities overnight Sunday night.

Severe Thunderstorms. While the severe thunderstorm threat is not as great with this event, it does exist and will need to be monitored. Our central Texas counties....mainly along and south of a Comanche to Hillsboro to Athens line will have the greatest potential for any severe storms, primarily Sunday afternoon and evening.

CONFIDENCE: We're very confident that we're going to have a healthy rainfall event across North and Central Texas, and that it will be focused in the Sunday throughMonday period. Some jurisdictions in our forecast area will very likely experience flash flooding and river flooding as a result. We're only moderately confident at this point, however, in the exact timing and location of the heaviest rain and flooding within the Sunday - Monday period. Because of this, all jurisdictions need to monitor the ongoing forecasts tonight through Sunday for later updates and probable watches and warnings.

We'll send another update tomorrow. Otherwise, don't hesitate to chat us or send us an email if you have any immediate questions.

Thanks,

Tom/Mark

The afternoon update for South Texas from EWX in New Braunfels…

jbd/vex

From: Larry.Hopper@... [mailto:Larry.Hopper@...] On Behalf Of SR-EWX Alert - NOAA Service Account
Sent: Saturday, April 16, 2016 15:48
To: undisclosed-recipients:
Subject: Flash Flood Watch Issued for most of South Central Texas Beginning Sunday at 10 AM

Good morning South-Central Texas Partners,

Headline:

Flash Flood Watch for most of South Central Texas has been issued from 10 AM Sunday to 10 AM Tuesday

Area of Concern:

All of South Central Texas, with the heaviest rainfall expected primarily along and east of Highway 281 and along and north of Interstate 10 (see attached graphic for area of highest threat). This includes both the San Antonio and Austin metro areas.

Threats & Impacts (see attached graphics):

Rainfall Amounts: (48 hour totals from Sunday morning - Tuesday morning)

* Widespread 3-6 inches expected over most of South Central Texas with isolated amounts of 8-12 inches mainly east of Highway 281 and north of Interstate 10.

* Lesser amounts of 1-3 inches over the Rio Grande Plains and Edwards Plateau regions.

* Impacts: Flash and River Flooding will be the primary concern. Rising levels on rivers, creeks, and streams and increasing soil moisture levels will continue to increase this threat over the 48 hour period ending Tuesday morning.

Severe Weather:

* Although it will be secondary to the heavy rainfall and flash flooding threat, isolated damaging winds and isolated brief tornadoes will be possible, particularly Sunday afternoon and evening. The threat for large hail is relatively low. Another threat for severe weather is also expected on Monday with another round of storms.

Timing and Overview:

An upper level low over the the southwestern United States will produce chances for multiple rounds of showers and thunderstorms Sunday through Tuesday. Locally heavy rainfall and severe weather will be a concern across South Central Texas Sunday afternoon through Tuesday morning. The first round is expected to begin late Sunday morning and lasting into the evening as a stalled surface boundary helps provide an additional focus for storms. At least one more round of storms is expected on Monday, but the timing of storms and their impacts will depend upon what happens on Sunday.

Confidence:

* Heavy Rainfall Potential: High

* Rainfall Amounts and Impacts: Moderate to High

* Severe Weather Potential: Moderate

* Timing of Sunday Storms: Moderate to High

* Timing of Monday Storms: Low to Moderate

Additional Information Resources:

* NWS Austin / San Antonio Contact Numbers: 800-292-5508 <tel:888-579-9731> or 830-606-3617 <tel:361-289-0725>

BCC: MY WEATHER LISTS…

This was an early afternoon update from Fort Worth NWS…

Looks like we are still on for a severe wet Sunday afternoon. The predicted Saturday wet has not yet occurred at Dornville...

jbd/vex

From: Jason Dunn - NOAA Federal [mailto:jason.dunn@noaa.gov]
Sent: Saturday, April 16, 2016 12:21
To: Jason Dunn - NOAA Federal <jason.dunn@...>
Subject: NWS Dallas/Fort Worth Update: Flooding/Severe Weather Potential Late Weekend/Early Next Week

Good afternoon everyone,

No major changes to the flood forecast are expected although the severe weather threat has increased for Sunday afternoon and evening. Scattered showers and thunderstorms are still expected to develop well west of I-35 later this afternoon and evening and will increase in coverage overnight. All of this activity is expected to slowly move eastward overnight tonight. More numerous showers and thunderstorms will overspread all of North and Central Texas during the day Sunday. The heavy rainfall threat will persist across parts of the area through at least Monday night. (Please see the attached graphics for details.)

BOTTOM LINE: Flash flooding, river flooding and isolated severe thunderstorms are ALL expected to occur to varying degrees Saturday night through Tuesday morning. Not everyone will be hit equally with heavy rainfall, but at this point we're asking all of our core partners to be prepared for response activities. This could be an event where a few selected local jurisdictions are confronted with very significant flash flooding late Sunday/Sunday night and possibly again Monday night.

Contingency plans should be in place for any weather sensitive activities over the remainder of the weekend (especially Sunday).

KEY THREATS: Flash flooding and river flooding for the next several days. Storm total rainfall amounts of 2 to 4 inches are expected over nearly all of North and Central Texas, with locally higher amounts of 4 to 8 inches possible. Flash flooding will be a key threat, followed by river flooding along many of the primary basins.

The severe weather threat is increasing with this event...especially Sunday afternoon and evening. Wind profiles and instability are becoming favorable for tornadoes...possibly embedded within lines of storms. These are usually fast moving and embedded within areas of heavy rainfall. Some damaging winds and hail will also be possible but the large hail threat will not be as high as in previous events.

LOCATIONS/TIMING:

Flooding. The area of greatest concern for flash flooding is along and south of Interstate 20, particularly in those counties roughly bounded by I-35 and I-45. We may see some isolated heavy rainfall over our far western counties as early as 4 am Sunday. However, the time period of greatest flash flood threat will be after 4 pm Sunday afternoon, extending overnight Sunday night into midday Monday. We stress that our confidence in the timing and location of the heaviest rainfall is only moderate at this time. There is also a chance for an additional round of very heavy rainfall in the same area mentioned above late Monday into Monday night. We do encourage jurisdictions to be especially prepared for the possibility of flash flood response activities overnight Sunday night and possibly into Monday and Monday night.

Severe Thunderstorms. The severe thunderstorm threat has increased with this event...particularly south of Interstate 20. The highest threat for severe weather will be Sunday afternoon and evening...but there will be some threat into the overnight hours. This is a strong system and this threat will continue to be monitored closely.

CONFIDENCE: We're very confident that we're going to have a heavy rainfall event across North and Central Texas, and that it will be focused in the Sunday through Monday period. Some jurisdictions in our forecast area will very likely experience flash flooding and river flooding as a result. We're only moderately confident at this point, however, in the exact timing and location of the heaviest rain and flooding within the Sunday - Monday period. Because of this, all jurisdictions need to monitor the ongoing forecasts tonight through Sunday for later updates and probable watches and warnings.

Don't hesitate to chat us or send us an email if you have any immediate questions.

Thanks,

Jason

Subject: Update: Significant Weather Event Next Week

In conference call with State this morning NWS indicated higher confidence that we will have severe storms with possibility of damaging winds, flash and river flooding next week. Rain totals through Wednesday are higher for our area than forecasted yesterday as attached graphic indicates.

Preparatory actions should include the following.

1. Ready high profile vehicles and high water rescue equipment

2. Prepare and consider prepositioning barricades near low water crossings and roadways prone to flash flooding

3. Consider increased staffing during high risk periods

4. Assure availability of personal protective equipment for staff that will be working rescues and on the highways

5. Secure assets in flood prone areas

This office will continue to update you with the latest information available from NWS the DDC and the State Operations Center.

Please let me know if you find you have any unmet needs in your preparations to deploy emergency protective measures for this event.

Regards,

Michael Harmon

5953. FW: Flash Flood Watch in effect for most of south central Texas until Tuesday morning

Yahoo group: Temple_ARC
Date: 2016-04-17 13:31:18 UTC
From: Joe Dorn
Topic: 5953 Message: 5953
Attachments: 2 described; binary payloads are missing from this source WARC

Sunday Morning from EWX…

jbd/vex

From: Eric.Platt@... [mailto:Eric.Platt@...] On Behalf Of SR-EWX Alert - NOAA Service Account
Sent: Sunday, April 17, 2016 06:53
To: undisclosed-recipients:
Subject: Flash Flood Watch in effect for most of south central Texas until Tuesday morning

Good morning South-Central Texas Partners,

Headline:

Flash Flood Watch continues for most of South Central Texas from 10 AM Sunday to 10 AM Tuesday

Area of Concern:

All of South Central Texas, with the heaviest rainfall expected primarily along and east of Highway 281 and along and north of Interstate 10 (see attached graphic for area of highest threat). This includes both the San Antonio and Austin metro areas.

Threats & Impacts (see attached graphics):

Rainfall Amounts: (48 hour totals from Sunday morning - Tuesday morning)

* Widespread 3-6 inches expected over most of South Central Texas with isolated amounts of 8-12 inches mainly east of Highway 281 and north of Interstate 10.

* Lesser amounts of 1-3 inches over the Rio Grande Plains and Edwards Plateau regions.

* Impacts: Flash and River Flooding will be the primary concern. Rising levels on rivers, creeks, and streams and increasing soil moisture levels will continue to increase this threat over the 48 hour period ending Tuesday morning.

Severe Weather:

* Although it will be secondary to the heavy rainfall and flash flooding threat, isolated damaging winds and isolated brief tornadoes will be possible, particularly Sunday afternoon and evening. The threat for large hail is relatively low. Another threat for severe weather is also expected on Monday, mainly for areas south of a Del Rio to New Braunfels line.

Timing and Overview:

An upper level low over the the southwestern United States will produce chances for multiple rounds of showers and thunderstorms Sunday through Tuesday. Locally heavy rainfall and severe weather will be a concern across South Central Texas Sunday afternoon through Tuesday morning. The first round is expected to begin late Sunday morning and lasting into the evening as a stalled surface boundary helps provide an additional focus for storms. At least one more round of storms is expected on Monday, but the timing of storms and their impacts will depend upon what happens on Sunday.

Confidence:

* Heavy Rainfall Potential: High

* Rainfall Amounts and Impacts: Moderate to High

* Severe Weather Potential: Moderate

* Timing of Sunday Storms: Moderate to High

* Timing of Monday Storms: Low to Moderate

Additional Information Resources:

* NWS Austin / San Antonio Contact Numbers: 800-292-5508 <tel:888-579-9731> or 830-606-3617 <tel:361-289-0725>

* NWS Austin / San Antonio Webpage: http://www.weather.gov/sanantonio

* Online Severe Weather Reporting: http://www.srh.noaa.gov/StormReport/SubmitReport.php?site=EWX

Request for Information:

Please relay severe weather reports and/or photo’s of severe weather to sr-ewx.alert@... <mailto:sr-ewx.alert@...>

To: undisclosed-recipients:
Subject: Flash Flooding and Severe Weather Ongoing - NWS Briefing Email

Good Evening South-Central Texas Partners,

Headline:

Flash Flood Watch continues for most of South Central Texas now through 10 AM Tuesday

Areas of heavy rainfall leading to flash flooding and severe storms have already occurred and conditions will persist to support these hazards overnight into Monday.

Area of Concern:

The heaviest rainfall is expected primarily along and east of Highway 281 and along and north of Interstate 10 (see attached graphic for area of highest threat). This includes both the San Antonio and Austin metro areas. Heavy rainfall is ongoing west of the I-35 corridor as of 5pm and an additional round is expected this evening into Monday morning as a frontal system shifts south.

Threats & Impacts (see attached graphics):

Rainfall Amounts: (48 hour totals from 12pm Sunday - 10am Tuesday)

* Widespread 3-8 inches expected over most of South Central Texas with isolated amounts of 8-12 inches mainly east of Highway 281 and north of Interstate 10.

o Amounts up to 15 inches could be possible in the white highlighted areas in the graphic with additional rainfall overnight and Monday morning.

* Lesser amounts of 1-3 inches over the Rio Grande Plains and Edwards Plateau regions.

* Impacts: Flash and River Flooding will be the primary concern. Rising levels on rivers, creeks, and streams and increasing soil moisture levels will continue to increase this threat over the 48 hour period ending Tuesday morning.

Severe Weather:

* Although it will be secondary to the heavy rainfall and flash flooding threat, isolated damaging winds and dime to quarter sized hail could be possible. An isolated, brief tornado will be possible this evening. The threat for large hail is relatively low. Another threat for severe weather is also expected on to continue into Monday morning and afternoon along and south of a Del Rio to La Grange Line.

Timing and Overview:

An upper level low over the the southwestern United States will produce chances for multiple rounds of showers and thunderstorms Tonight through Tuesday. Locally heavy rainfall and severe weather will be a concern across South Central Texas now through Tuesday morning. The first round has begun this afternoon with additional activity lasting into the evening as a stalled to slowly moving southward surface front helps provide an additional focus for storms. At least one more round of storms is expected on Monday, but the timing of storms and their impacts will depend upon what happens on overnight. Please stay tuned to updates.

Confidence:

* Heavy Rainfall Potential: High

* Rainfall Amounts and Impacts: Moderate to High

* Severe Weather Potential: Moderate

* Timing of Storms Sunday Night: Moderate

* Timing of Monday Storms: Low to Moderate

Additional Information Resources:

* NWS Austin / San Antonio Contact Numbers: <tel:888-579-9731> 800-292-5508 or <tel:361-289-0725> 830-606-3617

Subject: NWS UPDATE: That's Right...More Rain

Good afternoon,

In the next few lines, one of you will wonder if we just recycled yesterday's forecast for tonight. While that may be partially true, there are some differences. A short PDF has been attached to show the areas depicted and additional details.

BOTTOM LINE: Emergency management, government officials, media, and other core emergency response partners should be prepared for another round of showers and thunderstorms during the overnight hours tonight/Thursday morning. The primary concern will be the additional rain, which will aggravate/extend any flooding issues. There will be the possibility of a severe thunderstorm or two. The bigger issue will be the additional rainfall and runoff.

THREATS / RISKS: Thunderstorms will have the potential for dangerous cloud to ground lighting, damaging winds, and hail to the size of quarters. The tornado risk appears low. Rainfall, which will only average 1/2 to 1" may cause ongoing flooding issues to continue or slightly worsen. Much like last night, the rainfall rate will be a bigger issue than the rainfall amounts.

LOCATIONS, AMOUNTS, AND TIMING: Please see the attachment for details. In general, the highest potential for severe thunderstorms will be west of I-35/35W. The heaviest rainfall will likely be north of I-20 and west of I-35/35W.

ALTERNATE OUTCOMES: Sunshine will not be our friend today, either where we are, or in the Texas/Oklahoma panhandle. Last night's system stabilized the atmosphere somewhat, so we think we will not necessarily see a repeat of last night. If we are able to break out with a large area of sunshine today, that would lead to increased chances for severe thunderstorms.

CONFIDENCE: We have high confidence in the potential for additional rain and a few thunderstorms tonight. We have less confidence at the moment for the potential for widespread severe weather.

Is rain guaranteed: No. Not everyone will see rain.

Is severe weather guaranteed? No.

Slide 6 shows no rain in my area, so I'm fine? No. That is a model forecast that shows us the type of thunderstorms. In this case, a cluster of storms is expected to move out of the panhandle. .

How big will the hail be at my house? Small hail will be the primary threat with these storms, if any. Damaging winds will be the primary risk.

Will there be tornadoes? Most likely, no. If there are, they would be on the leading edge of the line.

When will you send out another email update? This is the last email update for this event. (there will be many more next week, however)

How does the weekend and next week look? After this, there will be a brief, 2-3 day lull in the rain. Friday and Saturday look great. Next week, however, will be an active week. When the weather clears, hopefully you can take some time off. By Tuesday and Wednesday of next week, we will be looking at additional severe thunderstorm chances for North and Central Texas.

Please don't hesitate to contact us if you have any questions or concerns.

Thanks,

Mark

To: undisclosed-recipients:
Subject: NWS UPDATE: Potential for Severe Storms This Week

Good afternoon,

Thunderstorms are in the forecast all this week with several possibilities for severe storms. The biggest threat for severe storms and possibly isolated flooding will be Tuesday and Tuesday night, but severe storms may also occur Monday, Wednesday and possibly Thursday. The potential for any storms on Monday is low and will depend on if there is enough forcing to break the cap and get storms to develop. We are confident in the severe threat on Tuesday and Tuesday night but the potential for storms becomes challenging Wednesday and Thursday as it depends on what happens each day before. On Tuesday afternoon we expect severe storms to develop on the dryline located west of Interstate 35/35W and then move east, possibly merging into a squall line in the evening and overnight hours.

When will you send out another email update? The next update will be Monday before 2 pm.

BOTTOM LINE: Emergency management, government officials, media, and other core emergency response partners should be prepared for the possibility of several periods of severe thunderstorms this week. The threats will vary slightly each day, but large hail, damaging winds, tornadoes, and localized flooding will all be possible. The biggest threat for severe storms producing large hail, damaging winds, tornadoes, and localized flooding will be Tuesday and Tuesday night.

THREATS / RISKS: The threats will vary slightly each day, but large hail, damaging winds, tornadoes, and localized flooding will all be possible. If thunderstorms occur on Monday, they are expected to be isolated with a threat for large hail and damaging winds, but an isolated tornado cannot be ruled out. More scattered severe storms will develop Tuesday

afternoon before potentially merging into a squall line that continues moves east. Large hail, damaging winds, a few tornadoes and localized flooding will be possible Tuesday afternoon and night.

LOCATIONS, AMOUNTS, AND TIMING: Please see the attachment for more details. Although the low thunderstorm chances on Monday afternoon are along and east of a line from Gainesville to Weatherford to Comanche, a better potential for thunderstorms will exist closer to the dryline located west of Interstate 35/35W.

On Tuesday, thunderstorm development will likely occur in the late afternoon hours near the dryline located west of Interstate 35/35W. The chance for storms will continue into the evening and overnight hours as the storms merge into a squall line that moves east. Some locations affected by the squall line could receive close to 1" of rain which may exacerbate ongoing flood issues or cause new flood problems.

If thunderstorms occur Wednesday and/or Thursday, the afternoon and evening hours will be the most likely time period for storms. If there are storms on Wednesday, the most likely location would be east of Interstate 35/35E.

ALTERNATE OUTCOMES: The position of the surface features will have everything to do with where thunderstorms develop; especially the location of the dryline. No storms may occur on Monday if there isn't enough forcing. No storms may occur on Wednesday if the squall line pushes the dryline east of the region. There may not be enough large-scale forcing for storms on Thursday (Thursday could be a dry day, too).

CONFIDENCE: Confidence is high that there will be severe weather this week. Confidence is high in the severe weather threat and storm mode on Tuesday & Tuesday night. Confidence is high for the anticipated impacts with severe storms this week. Confidence is lower with the occurrence of severe storms Monday, Wednesday and Thursday, but our confidence increases some that IF storms occur on these days, some will be severe.

Is rain guaranteed: No. Not everyone will see rain but most will Tuesday and.or Tuesday night.

Is severe weather guaranteed? If so, where? Yes, severe weather is expected across parts of North and Central Texas this week but not everyone may be impacted by severe storms.

How big will the hail be at my house? Difficult to say, however, there is a potential for 2" hail or larger with supercell storms.

Will there be tornadoes? Tornadoes are possible.

Please don't hesitate to contact us if you have any questions or concerns.

Jennifer

Subject: NWS Dallas/Fort Worth Update: Severe Weather Potential Tuesday and Late Week

Good afternoon everyone,

It's been heavily advertised for days, and now it's upon us: a very busy weather week, with multiple opportunities for hazardous weather impacts across North and Central Texas. We now have a classic large-scale spring-time weather pattern in place over the region, highlighted by an active dryline. This will promote both severe thunderstorm and heavy rainfall potential - particularly Tuesday, early Wednesday, Friday and Saturday. Tuesday is our greatest concern right now, and is the highlight of this brief. Attached is a set of graphics illustrating the threats.

BOTTOM LINE: We ask all of our North Central Texas Integrated Warning Team partners and colleagues to GET READY for severe weather response activities Tuesday afternoon and Tuesday night. Over the course of the evening and night, most of the region will be impacted by strong to severe thunderstorms, with heavy rainfall and localized flooding becoming an increasing threat overnight. At this time, we don't see a set of ingredients that would suggest a major tornado outbreak for North Texas. The pattern looks a bit more favorable for more widespread and significant impacts north of the Red River in Oklahoma. Having said that, the conditions will certainly be in place across our area for large hail, damaging winds, and a few tornadoes. And any of these threats will have the capacity to kill or injure victims, obviously. Get your response and messaging plans in place now. We'll almost certainly have multiple watches in place for 6-12 hours across North Central Texas Tuesday night into early Wednesday, with commensurate weather impacts.

A quick note about Friday/Saturday: This will be our next primary period of active weather, with the potential for both severe weather AND an increased risk of heavy rainfall. River flooding and flash flooding may be a bigger concern for North and Central Texas during and following this weekend event.

KEY THREATS: This will be the kind of event that features both supercells (forming along the dryline)...and later on, a squall line. As such, we expect large hail and damaging wind to be a key threat into the evening hours. The development of one or more supercell-based tornadoes will also be a threat, especially from late afternoon into the evening hours. As we go deeper into Tuesday night/Wednesday morning, we'll see a transition to a more or less continuous line of storms. At that point, damaging wind will become the greater threat, accompanied by an increased risk of localized flash flooding as the line slows. A small tornado threat may still exist with the squall night after midnight, however.

Friday and Saturday, the key threats will again be large hail and damaging winds. Localized flash flooding will become a greater threat with this second round, however.

LOCATIONS, TIMING, AND AMOUNTS: We expect the initial storms to form along the dryline west of a Gainesville to Lampasas line after 3 pm Tuesday. The storm coverage will expand and move eastward toward the I-35 corridor by late afternoon or early evening, with a more continuous line of activity impacting most areas east of I-35 from late evening into the 3-4 am timeframe Wednesday. The greater threat for tornadoes - if do any form - will exist along and west of the I-35 corridor....while the greater threat for heavy rainfall and isolated flooding will exist along and EAST of the I-35 corridor from evening onward. Some isolated 2 to 4 inch rainfall amounts are not out of the question with this event, though these higher end totals will be quite localized.

For the late week event, we expect most of the region to be in play, with additional multiple inch totals possible. We'll certainly refine this in the coming days.

CONFIDENCE: Confidence is high that there will be large hail or damaging wind over North Central Texas Tuesday/Tuesday night, and we think we have a good feel for the locations as mentioned above. We also think there's a chance that at least one or more tornadoes will occur...AND....that isolated flash flooding will occur later in the event. Right now, we have moderate confidence that this will NOT turn out to be a widespread, major severe weather event - certainly from the standpoint of multiple strong tornadoes. Conditions look better for this up in Oklahoma, as of now. (Please understand, folk, THIS COULD CHANGE). As for the late week event, we're confident that we'll see thunderstorms, and they have a good chance of being severe with heavy rain. Rainfall amounts are not cast in stone yet, however.

We'll likely put out another short update Tuesday morning. In the meantime, please don't hesitate to contact us if you have any questions or concerns.

Thanks,

Tom

Subject: NWS UPDATE: Severe Weather Potential- Tuesday.

Good evening

Unless you have been purposely avoiding weather forecasts recently, you know today has the potential for severe weather in North and Central Texas. A short PDF has been attached to show the areas depicted and additional details.

BOTTOM LINE: Emergency management, government officials, media, and other core emergency response partners should be prepared to respond to impacts from severe thunderstorms, including large hail, tornadoes, damaging winds, and heavy rainfall. Spotters should be prepared for activation as early as this afternoon, and be prepared for spotting well into the evening and overnight.

THREATS / RISKS: Thunderstorms will have the potential for dangerous cloud to ground lighting, large hail, tornadoes, and damaging winds. The primary storm type will be isolated or scattered supercell thunderstorms, along with thunderstorm clusters. By this evening, we do expect the storms to also be prolific rain producers, so there is also the risk of heavy rain and additional flooding issues. Low lying areas, and especially areas near streams, rivers, lakes will be susceptible for flooding issues.

LOCATIONS, AMOUNTS, AND TIMING: Please see the attachment for details. In general, thunderstorms will develop by mid-late afternoon in the west, with discrete supercells possible. These storms will move east, and will morph into a broken line of thunderstorms, with embedded supercells. For the I-35 corridor (all of I-35 and both I35W and I35E), the general timing will be 6 PM to Midnight.

ALTERNATE OUTCOMES: The cap could inhibit storms from firing, but we continue to have increasing confidence that storms will initiate.

CONFIDENCE: Confidence is high in anticipated storm type and progression. Confidence is high for the anticipated impacts. Confidence remains lowest for exact locations and/or jurisdictions. Everyone in North and Central Texas has the potential for severe weather today.

FAQ:

Is rain guaranteed: No. Not everyone will see rain.

Is severe weather guaranteed? No, but the non-severe thunderstorm will be the exception, not the rule.

Timing is 6 PM - Midnight, so start watching then? No. Monitor the weather starting as early as 1 PM. Some storms will develop well before the main line.

What about overnight? There will be a threat for heavy rainfall and severe storms during the overnight hours. Plan accordingly.

How big will the hail be? There is a potential for 2" hail or larger with the strongest storms.

Will there be tornadoes? Tornadoes are possible today.

Anything special to watch for? Be aware of any storm that is able to form by itself (discrete cells). These will likely have the higher tornado threat.

When will you send out another email update? This is the last email update for Tuesday's event.

How does the rest of the week look? Additional thunderstorms and heavy rain are anticipated Thursday, Friday, and Saturday.

Please don't hesitate to contact us if you have any questions or concerns.

Thanks,

Mark

Subject: Severe Storms Possible Late This Afternoon through Early Wednesday

Good morning South-Central Texas Partners,

Headline:

...Strong to Severe storms possible late this afternoon through early Wednesday across portions of South Central Texas...

Area of Concern:

Hill Country to along and east of I-35 corridor.

Threats & Impacts:

Winds: Up to around 60 mph

Hail: Up to 3 inches in diameter

Tornadoes: Low

Rainfall: Localized up to 2 inches

Timing and Overview:

Strong daytime heating, moisture convergence, and instability will allow isolated to widely scattered showers and thunderstorms to develop across the eastern Hill Country to along and just east of I-35 between 5 pm and 9 pm. Large hail up to 3 inches in diameter is

the main threat.

A dryline over Val Verde County late this afternoon will surge east across the Hill Country this evening to near the I-35 corridor overnight. Showers and thunderstorms will develop along it over West Central Texas early this evening and then move across the Hill Country and South Central Texas late this evening through the overnight into early Wednesday. Large Hail up to 2 inches in diameter and damaging wind gusts up to 60 mph are the main threats, however, cannot rule out isolated tornadoes.

Confidence:

Hail/Winds: Moderate

Rainfall: Moderate

Torndoes: Low

From: paul.yura@... [mailto:paul.yura@...] On Behalf Of SR-EWX Alert - NOAA Service Account
Sent: Tuesday, April 26, 2016 15:34
Cc: Paul Yura - NOAA Federal <paul.yura@...>
Subject: Weather Update 330 PM Tuesday...Severe thunderstorms possible this evening and overnight.

Good afternoon South Central Texas Partners,

Headline:

...Strong to Severe storms possible this evening and overnight across portions of South Central Texas...

Area of Concern:

All of South Central Texas...but the best chances to see severe weather overnight will be across Llano, Burnet, and Williamson Counties. Everybody in the South Central Texas area is under the threat however, the farther you go north, the greater the chances.

Threats & Impacts:

Winds: Up 60-70 mph, possible wind damage

Hail: Up to 3 inches in diameter, car and roof damage.

Tornadoes: Isolated tornadoes possible.

Rainfall: Localized up to 2 inches, minor street/creek flooding possible.

Timing and Overview:

Isolated to widely scattered thunderstorms may form in the late afternoon heat later this afternoon and evening...mainly over the far western Hill Country. If these storms do develop, they will likely become severe very quickly with large hail (up to baseball size) being the main threat.

Later this evening and overnight, additional severe storms will form over North Central Texas. This area of thunderstorms is forecast to move southeast overnight and move into portions of South Central Texas during the overnight hours, likely around or after midnight. The thunderstorm threat should end by the predawn hours Wednesday morning.

Damaging winds, large hail, and isolated tornadoes are possible with this overnight activity. Locally heavy rain is possible with the storms, but the flooding threat remains very small.

Confidence:

Hail/Winds: Moderate

Rainfall: Moderate

Tornadoes: Low

From: Jennifer Dunn - NOAA Federal [mailto:jennifer.dunn@...]
Sent: Thursday, April 28, 2016 14:55
To: undisclosed-recipients:
Subject: NWS Dallas/Fort Worth Update: Severe Storms Tonight through Friday Night

Good afternoon,

We have been fortunate to have 2 dry days across the region, but rain and the threat for severe storms returns tonight through Friday night. There will be two rounds of storms that impact North and Central Texas with the better concentration for severe storms Friday afternoon through Friday night. Late tonight, the main threat will be hail, but the threats on Friday afternoon/night will be hail, damaging winds, the potential for a few tornadoes, and isolated areas of flooding. We expect Saturday will be dry, but if the front/dryline that is expected to move through with this system is slower, our eastern counties may have a small threat for severe storms near the front Saturday afternoon.

BOTTOM LINE: Our partners and colleagues need to be prepared to respond to severe weather Tonight through Friday night. Two rounds of rain, both with a potential for severe storms, are expected to impact the region. The first round will occur tonight with a threat for hail; mainly along and north of Interstate 20. A higher coverage of storms is expected with the second round Friday and Friday night with a threat for large hail, damaging winds, possibly a few tornadoes, and localized flooding.

KEY THREATS: Elevated storms tonight will be capable of producing hail up to 1.75" (golf ball sized). Localized heavy rainfall may occur early Friday morning north of Interstate 20 and east of Interstate 35.

Storms Friday afternoon and night will have a threat for large hail, damaging winds, possibly a few tornadoes, and isolated flash flooding.

EVOLUTION, LOCATIONS, TIMING, AND AMOUNTS: Please see the attachment for more information.

Tonight - Thunderstorms are expected to develop this evening in Central Texas and move north through the overnight hours. As they move north with the warm front, more storms will develop and this area of storms is expected to move north of the Red River early Friday morning. The coverage of storms will likely be isolated to scattered with a better chance for storms north of a Cisco to Canton line. Storms overnight will be capable of producing hail up to 1.75" (golf ball sized). Rainfall amounts are generally expected to be less than a half inch but some locations near the Red River could receive closer to one inch.

Friday - Friday night - The greatest coverage of storms is expected in this time frame. North and Central Texas will be located in the warm and humid sector ahead of an upper level system. The atmosphere will become uncapped, unstable and with sufficient shear values to support the development of severe storms and supercells with a threat for large hail, damaging winds and possibly a few tornadoes. As the cap weakens and instability increases, we expect thunderstorms to develop across North and Central Texas as early as midday. The radar appearance Friday afternoon could be a messy mix of isolated storms and clusters of storms spread across a good portion of the region. Not everyone will be impacted by severe storms but we anticipate a good portion of the region may be. In the evening and overnight hours, we expect the storms to gradually shift east into East Texas with the rain ending from west to east Friday night. Training storms could result in accumulations of 2-3 inches with locally higher amounts. The better potential for heavy rainfall resulting in localized flash flooding will be along and east of Interstate 35. Impacts to local creeks and rivers are possible, but as of now we do not anticipate any significant changes on main stem rivers.

ALTERNATE SCENARIOS: It is possible that storms overnight tonight may persist through the morning hours which may decrease the severe threat for the afternoon hours but would increase the heavy rainfall threat.

CONFIDENCE: Our confidence is high in the expected evolution and storm threats for both rounds of storms tonight through Friday night. Our confidence is lower in exact location of storms on Friday. While we think most of the region could see storms Friday afternoon and night, there are indications storms may not occur in our western counties.

Will this system be stronger than the Tuesday squall line: We think so but we do not anticipate a severe weather outbreak.

Is rain guaranteed: No. Most people will receive rain but not everyone is guaranteed rain.

Is severe weather guaranteed? Yes, but not everyone will be impacted by severe storms.

How big will the hail be? There is a potential for 2" hail or larger with the strongest storms on Friday afternoon.

Will there be tornadoes? Tornadoes will be possible Friday. However, the likelihood of long track, strong tornadoes is low.

Will there be another email update sent tomorrow? If we aren't busy with ongoing storms and able to, we will try to issue an update Friday morning but no guarantees are being made. Refer to the links below and our social media feeds for updates during this evolving event.

Please don't hesitate to contact us if you have any questions or concerns.

Jennifer/Ted

<image.png>

Good morning,

Today is another day that springtime in Texas will assert herself. There is an abundance of low level moisture, instability, and favorable wind shear for severe thunderstorms today, including the potential for large hail and tornadoes. A surface low is over the south plains this morning, with a warm front draped just south of the Red River. Unfortunately, this is a classic severe weather setup for North and Central Texas. A short PDF has been attached to show the areas depicted and additional details.

BOTTOM LINE: Emergency management, government officials, media, and other core emergency response partners should be prepared for the possibility of significant severe weather

impacts today or tonight. Jurisdictions with outdoor events should review their safety plans early today, then be prepared to enact those plans if conditions warrant. While severe weather will get your attention, there is also a risk of heavy rainfall and flash flooding, especially if storms begin to stall. Watch closely for any discrete thunderstorms. Timing of any one individual location will be extremely tricky, and officials should continue to monitor conditions multiple times through the rest of the day.

THREATS / HAZARDS: Supercell thunderstorms will have the potential for tornadoes and large hail. Eventually, the storms will congeal into a line of thunderstorms and move east with more of a damaging wind threat.

LOCATIONS, AMOUNTS, AND TIMING: Please see the attachment for details. In general, the highest potential for severe thunderstorms will be east of a line from Killeen to Dallas to Cooper. The primary risk for severe thunderstorms will be midday to early evening.

ALTERNATE OUTCOMES: The only negative factor for severe weather today is the potential for too many storms to develop, and therefore not allowing any storm to get too severe. As with any significant tornado event or severe weather outbreak, the position of the small scale surface features will have everything to do with where thunderstorms develop and whether they will be capable of significant severe weather.

CONFIDENCE: Confidence is high in anticipated storm type and progression. Confidence is high for the anticipated impacts. Confidence is lower with exact areas to be impacted.

Is rain guaranteed: Pretty close, but there may be a few locations that miss out.

Is severe weather guaranteed? If so, where? No, but those that see thunderstorms this afternoon will have the potential for severe weather

How big will the hail be? Much like the storms last night in Bell County, there is the possibility of hail greater than 2" in diameter

Will there be tornadoes? Yes, tornadoes are possible today.

When will you send out another email update? This is the last email update for this event.

How does this compare to Tuesday? This setup looks much more impressive than the setup we saw on Tuesday.

Please don't hesitate to contact us if you have any questions or concerns. Just as a FYI...Mark's cell phone is dead in the water.

Thanks,

Mark

Good Afternoon South-Central Texas Partners,

Headline:

...Slight to Enhanced Risk for Severe Storms this Afternoon and Evening across portions of South-Central Texas...

Area of Concern:

Greatest threat for severe storms: Enhanced Risk (orange) and Slight Risk (yellow) shaded on the attached map. This includes areas across the eastern Hill Country as well as along and east of I-35 (including Austin and San Antonio).

Greatest threat for pockets of locally heavy rainfall: East of I-35.

Threats:

Hail: Up to 2 inches in diameter

Winds: Damaging wind gusts of 60 to 70 mph

Rainfall: 1/2 to 2 inches. Isolated pockets up to 4 inches mainly east of I-35.

Tornadoes: An isolated tornado or two is possible

Timing and Overview:

We expect showers and thunderstorms to become more numerous and stronger through the afternoon, then move east into the late evening. Conditions are favorable for some storms to become strong to severe across the eastern Hill Country and along and east of I-35. The severe threat should diminish by midnight. In addition, some locally heavier pockets of

rainfall are possible, especially east of I-35.

Confidence:

Severe: Moderate

Rainfall: Moderate to High

Timing: Moderate to High

To: undisclosed-recipients:
Subject: NWS Update: Severe Storm Potential Sunday and Monday

Good afternoon,

Our next storm system is currently in southern California and will be moving east this weekend. Saturday will be a dry and pleasant day but rain chances return on Sunday with a risk for severe storms at least Sunday and Monday. On Sunday, the chances for severe weather will be in our western counties, but more of the area may be impacted on Monday. At this time, we expect the better severe weather threat to be on Monday. There will still be rain chances for the remainder of the week with some severe storm risk, but currently our focus is on Sunday and Monday.

BOTTOM LINE: Our partners and colleagues need to be prepared to respond to severe weather Sunday through Monday evening with a better potential for severe storms on Monday. This severe weather event is expected to be typical of a spring-time severe weather event with a threat for large hail, damaging winds, possibly a tornado or two and localized flash flooding where heavy rain occurs. Not everyone will have thunderstorms or severe storms in their immediate area, but everyone needs to be prepared for the potential for severe storms during this time period. On Sunday, the threat for severe storms is expected to be along and west of Highway 281. More of the region may be impacted by severe storms on Monday as the dryline moves into the region.

KEY THREATS: All severe storms will be capable of producing large hail and damaging winds. On Monday, a low tornado threat will exist and also a threat for localized flooding where heavy rains occur with the stronger storms. This is not expected to be a widespread outbreak of severe storms or flooding.

LOCATIONS, TIMING, AND AMOUNTS: Please see the attachment for more information.

Sunday - Isolated to scattered thunderstorms may occur across all of North and Central Texas during the day. Although the radar may look busy during the day, these storms will be above a cap in place across the region with a low potential for producing severe weather, but may produce small hail. The better threat for severe storms will be in the late afternoon and evening hours in our western counties as the dryline approaches this area. The cap may weaken enough with storms developing near the dryline west of our area Sunday afternoon and evening. If storms develop along the dryline they may be severe and move into locations along and west of Highway 281 during the late afternoon and evening hours. Hail up to the size of golfballs and strong winds near 60 mph are expected to be the main threats with severe storms Sunday afternoon and evening.

Sunday Night - There is uncertainty regarding what will happen Sunday night. In the evening hours, storms may be occurring in our western counties off the dryline, and these storms could still be moving east during the nighttime hours. However, the risk for severe storms will lower as the storms move east and run into the cap. Additional isolated elevated storms with a threat for hail may develop during the overnight hours.

Monday & Monday Night - Thunderstorms overnight may still be ongoing in the morning hours and/or additional storms may develop as larger scale lift spreads over the region. These storms could be severe with a threat for hail and strong winds. The better potential for severe storms will be in the afternoon and evening hours as the dryline moves into the region and storms develop along and east of the dryline. We have moderate confidence at this time that the dryline will still be west of Interstate 35 by midday Monday but most of the region is still highlighted under a severe storm threat for Monday due to uncertainty in exactly where the dryline will be. It's possible storms will not just form near the dryline but anywhere east of the dryline in the humid and unstable atmosphere. Hail up to the size of tennis balls, damaging winds, possibly a tornado or two and localized flooding where heavy rains occur with the stronger storms will be the threats Monday and Monday night.

ALTERNATE SCENARIOS: If the cap weakens more than expected during the day on Sunday, there could be an increased threat for severe storms on Sunday across all of North & Central Texas. If convection overnight Sunday into Monday morning is stronger and/or more widespread, this would likely impact the severe weather risk for Monday afternoon and evening.

CONFIDENCE: Our overall confidence in the event is moderate. We have high confidence that we will see severe storms somewhere in our coverage area. We have moderate to high confidence in the location of the better severe weather threat Sunday afternoon and evening. We have high confidence there will be severe storms on Monday, but we have a lower confidence in exactly where the severe weather risk will be Monday.

Is rain guaranteed: Yes, but not everyone will receive rain.

Is severe weather guaranteed? Yes, but not everyone will be impacted by severe storms.

How big will the hail be? There is a potential for 2" hail or larger with the strongest storms.

Will there be tornadoes? A tornado or two will be possible Monday.

When will the next update be? The next update will be Saturday or Sunday.

Please don't hesitate to contact us if you have any questions or concerns.

Jennifer

Subject: NWS Fort Worth/Dallas Update - Severe Weather Potential Today Through Monday

Good Mother's Day morning everyone,

Here's a quick update on our severe weather potential for today, tonight and Monday. A large upper level storm system is located over the Intermountain West this morning, but it will move into the Central Plains States over the next 48 hours. As it departs the Rockies, it will promote rising motion and increased instability in the atmosphere over North Central Texas. We're starting to see the effects of this already, with light rain showers - and even a few rumbles of thunder - developing across the area. We have plenty of low level moisture in place, and a sufficient amount of wind shear, so a threat of severe thunderstorms will exist across our area through Monday.

BOTTOM LINE: Most of North and Central Texas will experience scattered thunderstorms from this afternoon through Monday evening. We may see some large hail in our western counties late today, but our main concern will be Monday afternoon/evening - along and east of I-35 - where a combination of large hail, damaging winds, and even a tornado or two could occur. We're not overly concerned about the magnitude of our severe prospects today/tonight. We'll need to watch Monday a bit more closely, however, because the instability and shear will be sufficient for strong supercell thunderstorms...and the varied hazards they tend to bring. We ask our EM, media and other core Integrated Warning Team partners to stay alert for storms later today, and particularly on Monday, when a greater threat exists.

THREATS/LOCATIONS/TIMING TODAY: Scattered, high-based thunderstorms are expected to develop after 3 pm today, mainly west of a Bowie to Comanche line. Initially, the main threat with these storms will be large hail, and possibly some strong wind gusts. The storms will drift eastward after dark, affecting the I-35 corridor late this evening through the overnight hours. Severe weather is unlikely after dark, but brief heavy rainfall and frequent lightning is possible.

THREATS/LOCATIONS/TIMING MONDAY: Scattered thunderstorms are expected to persist across much of North and Central Texas overnight and through the morning hours Monday. However, our main concern will be centered along and east of the I-35 corridor from Noon through 6 pm. During this time period we may see scattered supercell storms, with enough wind shear to produce a risk of a tornado or two. Areas along and north of I-20 will be at greatest risk for a severe storm. This doesn't appear to be an "outbreak" setup Monday, but the overall look of the pattern (occurring in early May) suggests we'll all need to stay alert.

LATER IN THE WEEK: We'll have a continued potential for thunderstorms through the rest of the week. Some of these storms may be severe (with hail the threat), but the overall risk does not appear as significant as the one we face Monday.

CONFIDENCE/ALTERNATIVE SCENARIOS: We're not totally convinced that severe thunderstorms will form later today. The thing that may hold them back would be the ongoing presence of a cap. If they DO form, however, we're very confident that large hail would be the threat out to the west of I-35. Tonight and Monday morning, we really think the prospects for severe weather are very low. However, if the lift increases somewhat, we may develop enough instability aloft to produce some hail to 1 inch late tonight or Monday morning. We think this is unlikely. We have moderate confidence that we'll see strong to severe storms Monday afternoon, and that they'll be confined to areas along and east of I-35. The main alternative scenario Monday would be that the favorable wind structure doesn't quite come together, limiting the potential for rotating storms and tornadoes.

We'll put out another quick email tomorrow morning. In the meantime, please don't hesitate to call, e-mail or chat us if you have any questions.

Thanks,

Tom

Subject: Severe Storms Possible This Afternoon and Evening

r

Good morning South-Central Texas Partners,

Headline:

…Severe Thunderstorms Capable of Very Large Hail Possible This Afternoon and Evening...

Area of Concern:

Areas north of an Eagle Pass to San Antonio to Austin line will have a risk for severe storms, but locations north of a Rocksprings to Fredericksburg to Burnet line will have the higher chances for severe storms. This area is under a slight risk for severe storms. See the graphic for more details.

Threats & Impacts:

Hail: Hail up to 2.5 inches (tennis ball) will be possible

Winds: Winds up to 65 MPH will be possible

Tornadoes: Not anticipated but can't be ruled out.

Rainfall: Generally less than an inch on average with isolated locations over 2 inches possible.

Timing and Overview:

Storms are expected to develop this afternoon mainly in the Hill Country and near the Rio Grande River. Some of these storms could be severe with large hail and damaging winds the main threats. There is a potential for slow moving storms and isolated locations could

receive over 2 inches of rain from the heavier activity. Storms should weaken by midnight with the loss of daytime heating.

Confidence:

Hail: Moderate

Wind: Low-Moderate

Rainfall: Low

Subject: NWS UPDATE: Thunderstorm Potential This Afternoon

Good afternoon,

North Central Texas will be in an active weather pattern through Thursday with repeated rounds of strong to severe storms. Unlike yesterday, when only isolated storms were expected, storm coverage over the next few days will be greater. The atmosphere will be very unstable which will enhance the risk of large hail and damaging winds, but there will not be as much organized wind shear so we are not concerned about strong or long-lived tornadoes, but a potential for brief tornadoes still exists.

BOTTOM LINE: Emergency management, government officials, media, and other core emergency response partners should be actively monitoring for the potential for severe thunderstorms this afternoon and evening, Wednesdayafternoon and evening, and all day Thursday.

LOCATION/TIMING/THREATS EACH DAY:

3 pm today through midnight tonight: Storms will fire near a dry line located roughly from Gainesville to Mineral Wells to Comanche from 3 pm to 6 pm. Most of the thunderstorm activity and severe weather risk will be south of I-20 with just isolated storms possible north of I-20. Large hail up to the size of baseballs will be possible with any of the isolated cells that develop between 3 pm and 8 pm. South of I-20, storms should congeal into line clusters by early evening as they move eastward, with damaging winds to 70 mph becoming the primary threat during the 6 pm to 10 pm hours. Locally heavy rainfall and copious lightning should occur with any thunderstorms. All storms should diminish by

midnight.

Wednesday afternoon and evening: The severe thunderstorm potential exists mainly to the west of line from Goldthwaite to DFW to Sherman. Supercell thunderstorms or clusters of storms are likely to develop by late afternoon. Large hail to the size of tennis balls and damaging winds are the main threats. Storms may have difficulty moving eastward into the I-35 corridor during the evening hours, but we can't discount that possibility just yet.

Thursday: A cold front will move through during the day, with scattered storms developing along it. The main severe weather threat will be hail and damaging winds. Storms on Thursday look to be less intense than today and tomorrow.

ALTERNATE OUTCOMES:

There is a small potential that several supercell storms could form north of the I-20 corridor along the dry line. These storms could be very intense with a higher tornado threat if low level winds are stronger than expected. We will monitor this closely during the day and provide any updates our thinking in chat and with additional graphicasts.

Wednesday's storm activity may be affected by the scope and coverage of today's storms. If widespread storm coverage occurs tonight, there would be less storms Wednesday.

The front could move through faster on Thursday which would lower the thunderstorm potential if it came through during the early morning hours.

CONFIDENCE: Confidence in this afternoon and evenings forecast is high. Confidence in the forecast for Wednesday and Thursday is moderate.

Is rain guaranteed: No. About 50% of the area each day will not see any rain.

Is severe weather guaranteed? We expect several severe weather reports in our region today, but not all thunderstorms will be severe.

Will there be tornadoes? Brief tornadoes are still possible, but not like what Oklahoma saw yesterday. Hail and damaging winds are the greater risks.

When will you send out another email update? We should send another email Wednesday.

How does the rest of the week look? There will be a break in the thunderstorm and severe potential Friday. Thunderstorm chances return this weekend, but there are no clear forecast signals regarding the strength of these storms yet.

Please don't hesitate to contact us if you have any questions or concerns.

Jason/Ted

From: Mark Fox - NOAA Federal [mailto:mark.fox@...]
Sent: Monday, May 16, 2016 12:45
To: undisclosed-recipients:
Subject: NWS UPDATE: Active Week - Thunderstorms / Heavy Rainfall

Good afternon,

This week will be an active week, with multiple chances for rain, and locally heavy rain. Somewhat uncharacteristic of mid May, the severe thunderstorm risk is somewhat limited. However, this is a week where there will be multiple days of thunderstorms, including brief windows for strong to severe thunderstorms. A short PDF has been attached to show the areas depicted and additional details.

BOTTOM LINE: Emergency management, government officials, media, and other core emergency response partners should actively monitor the forecast and current weather this week. Be prepared for the potential for strong to severe thunderstorms, as well as heavy rainfall and flooding potential Tuesday. Another round of rain and strong thunderstorms are expected to return Wednesday night through Thursday Night. Severe potential appears to be low, with heavy rainfall possible.

THREATS / RISKS: Thunderstorms will have the potential for dangerous cloud to ground lighting, damaging winds, and hail up to the size of ping pong balls. Flooding of traditional low lying areas (creeks, streams, construction areas) will be possible.

LOCATIONS, AMOUNTS, AND TIMING: Please see the attachment for details. Rain and thunderstorms will remain in the forecast most of the week. Rain will not be continuous and rainfall rates....not necessarily amounts...will likely determine localized flooding potential.

ALTERNATE OUTCOMES: Several.The severe potential for Tuesday will hinge on what happens, or doesn't happen, overnight tonight across West Texas. Confidence is low in a forecast of a complex of thunderstorms moving through North and Central Texas during the overnight/early morning hours on Tuesday. If this happens, the severe weather chances decrease dramatically

for our area. If not, the severe weather chances remain.

CONFIDENCE: Confidence is high for Today's forecast. Most, if not all, will not see severe weather today. Confidence is a bit lower for the forecast overnight tonight and Tuesday, with some severe weather possible.

Is rain guaranteed: No.

Is severe weather guaranteed? For the most part, severe weather will be the exception, and not the rule.

How big will the hail be? Hail could get as large as ping pong balls (1.5"). Wind gusts over 60 mph will be the primary threat.

How much rain will fall? This, of course, if highly dependent on several factors. On average, there will be 1-3" rain through Thursday night. (There will be localized amounts higher and lower than this range!)

When will you send out another email update? Another email will be sent on Tuesday.

Please don't hesitate to contact us if you have any questions or concerns.

Thanks,

Mark

To: undisclosed-recipients:
Subject: NWS Fort Worth Update: Heavy rainfall and thunderstorm potential through Friday

Good afternoon everyone,

Just a real quick update on the thunderstorm and heavy rainfall potential over North and Central Texas tonight through Friday...

BOTTOM LINE: Our severe thunderstorm potential will be low through Friday, though lightning will be a threat at times. Likewise, our threat of significant flooding is low, but a few smaller watersheds could pick up enough heavy rainfall to produce localized flooding issues Thursday. Flash flooding is not expected on a grand scale, but local public safety and public works jurisdictions need to be prepared for a few problems.

LOCATIONS/AMOUNTS/TIMING: A stout upper level storm system will move across the region Thursday, and this will trigger widespread rainfall across North and Central Texas from later tonight through late Thursday night. Thunderstorms may be embedded within the larger areas of rain, particularly south of Interstate 20 late tonight into Thursday evening. Some of the rain will be heavy at times, and most areas will see at least 1 to 2 inches of rainfall. However, some spots south of I-20 will see anywhere from 2 to 3 inches...and we can't rule out the possibility that a spot or two will wind up with up to 4 inches through Friday morning.

For the most part, the rainfall rates should not be great enough to produce widespread flash flooding. However, low areas and other chronic flooding locations may experience problems, particularly if repeated waves of heavier rain pass over the same locations.

As mentioned, our severe threat is low through Friday. Having said that, a few of the storms Thursday afternoon may develop sufficiently to produce some small hail and gusty winds. Areas affected by any of these storms would be south of a Comanche to Waco to Centerville line.

Don't hesitate to call, e-mail, or NWSChat us if you need any kind of updated information or other assistance.

Thanks,

Tom

To: undisclosed-recipients:
Subject: Flash Flood Watch Issued for all of South Central Texas on Thursday (1 AM until 10 PM)

Good Afternoon South-Central Texas Partners,

Headline:

...Flash Flood Watch Issued for all of South Central Texas on Thursday (1 AM until 10 PM)...

Area of Concern:

All of South Central Texas for flash flooding and subsequent river flooding, with a slight risk for severe storms and isolated tornadoes primarily in the Coastal Plains. See attached graphics.

Threats & Impacts:

Tornadoes: A few tornadoes in the Coastal Plains possible, low risk elsewhere

Winds: Up to 60 mph

Hail: Most up to quarter size, with isolated reports up to golf ball size

Rainfall: Widespread 1-3 inches with isolated higher amounts above 3 inches

Timing and Overview:

Another upper level disturbance approaching from the west will produce widespread 1-3 inch rainfall totals across South Central Texas. Saturated soils and relatively high rivers, streams, and reservoirs due to heavy rainfall over the past five days will cause most of this rain to runoff into area creeks, streams, and low lying areas. Widespread showers and thunderstorms that develop west of the region are expected to move into the Rio Grande Plains and Edwards Plateau after Midnight before progressing east into the Hill Country and I-35 corridor tomorrow morning and Coastal Plains late tomorrow morning. Storms should clear the area from west to east ending by late tomorrow evening in the Coastal Plains to end the flash flood threat.

Although the primary threat will be flash flooding and subsequent river flooding, severe storms capable of producing a few tornadoes, large hail, and damaging winds will be possible for areas located along and south of a frontal boundary. This front is currently expected to move into the Coastal Plains where the threat for severe storms is greatest, but is expected to remain southeast of the I-35 corridor and areas northwest of that where the threat is marginal. Shifts in the location of this front may cause this severe threat to increase or decrease further in area tomorrow.

Confidence:

Rainfall Amounts: Moderate to High

Flash Flooding Impacts: Moderate

Severe Weather Impacts: Low

To: undisclosed-recipients:
Subject: Weather update...930 AM...

Good Morning South-Central Texas Partners,

Headline:

...Flash Flood Watch Continues for all of South Central Texas until 10 PM...

...Severe Thunderstorm Watch in effect until 3 PM for Frio, Atascosa, Wilson, Karnes, DeWitt Counties...

Area of Concern:

All of South Central Texas for flash flooding and subsequent river flooding, with a slight risk for severe storms and isolated tornadoes primarily in the Coastal Plains. See attached graphics.

Threats & Impacts:

Rainfall: Widespread 1-3 inches with isolated higher amounts near 4 inches

Tornadoes: A few tornadoes in the Coastal Plains possible, low risk elsewhere

Winds: Up to 60 mph

Hail: Most up to quarter size, with isolated reports up to golf ball size

Timing and Overview:

The advertised weather system is moving through this morning. Rainfall totals out in the Hill Country have been on average 1-2 inches...isolated 3 inch totals. This has resulted in low end flash flooding with several roads closed in many of the counties along and west of

I-35. The band of heavy thunderstorms will push east of I-35 over the next few hours.

Areas west of I-35 and in the Hill Country will see additional rain totals of 1-2 inches over the next several hours. Rain rates however are fairly low...into the 0.25-0.50 inches per hour. But with the saturated soils this will continue to bring a flash flood threat. Expect more low water crossings and some roads to be closed. The severe threat will remain south and east of the San Antonio area where conditions are more favorable. Hail and Wind damage will be the main threat in the Coastal Plains area of Texas south of a Gonzales to Pleasanton line.

Models are showing most of the rain pushing east of I-35 by early afternoon...with the remainder of the rain pushing east out of South Central Texas by evening.

I believe this will continue to be a low end flash flood event with flood advisories being issued and a few flash flood warnings. Several rivers will go into Flood...but levels look to remain in the "Minor" category and should NOT bring significant river flooding.

Confidence:

Confidence in knowing what the threats will be has increased.

Rainfall Amounts: Moderate to High

Flash Flooding Impacts: Moderate to High

Severe Weather Impacts: Low to Moderate

Additional Information Resources:

* NWS Austin / San Antonio Contact Numbers: 800-292-5508 <tel:888-579-9731> or 830-606-3617 <tel:361-289-0725>

From: Jennifer Dunn - NOAA Federal [mailto:jennifer.dunn@...]
Sent: Sunday, May 22, 2016 13:28
To: undisclosed-recipients:
Subject: NWS UPDATE: Severe Storm Threat This Afternoon and Monday

Good afternoon,

A complicated forecast is expected this week with multiple chances for thunderstorms and a risk for severe storms. This email update will focus on the Sunday afternoon through Tuesday time period. Not all storms will be severe, and we will do our best to highlight when we think the better chances for severe storms will be, but convective evolution each day can affect the following day's forecast, resulting in potentially significant changes day-to-day, so check for new updates between the email updates using the links below. There are better chances for rain later this week starting on Thursday and there will be a risk for severe storms with the later week system, too.

BOTTOM LINE: Emergency management, government officials, media, and other core emergency response partners should be prepared for the possibility of isolated strong to severe thunderstorms this afternoon and evening across the entire area, with the highest potential along and west of I-35. Some storms may persist overnight, or even into early Monday morning. Additional isolated to scattered severe storms are possible Monday afternoon. Local officials should be prepared for an active week.

THREATS / HAZARDOUS WEATHER TYPES: Sunday: Isolated single cell or multicell storms are possible area-wide by late afternoon with low areal coverage. The main threats with any severe storms this afternoon and evening will be hail, damaging winds, and heavy rainfall causing localized flooding. Multicells with a few supercells should develop along the dry line in West Texas and may congeal into a complex which could move into North and/or Central Texas late Sunday evening/overnight. If this complex makes it into our area, there may be a wind threat as it moves into our western counties.

Monday: A cluster of storms may still persist into Monday morning. The severe weather threat with this complex during the morning hours would be low but may have a gusty wind

threat. This complex could leave residual boundaries in the area that would be a focus for new convection in the afternoon hours. Even if the complex is not in the North Central Texas area Monday morning, there is still a threat for isolated to scattered thunderstorms in the afternoon hours, and a few of these storms could be severe with a risk for hail, damaging winds, and heavy rainfall causing localized flooding.

Monday night/Tuesday: We will be further assessing the potential for another complex of storms to potentially impact the region, but at this time our confidence is low in any one scenario.

LOCATIONS, AMOUNTS, AND TIMING: Today: While thunderstorms are possible across the entire area, the highest likelihood of storms will be in the western portion of the NWS Fort Worth area of responsibility, generally along and west of I-35. Thunderstorms that develop in West Texas will move eastward on Sunday night, with the strongest thunderstorms being along and west of I-35. On Monday, a complex of storms may still be occurring over part of the region, but there is also a chance for thunderstorms in the afternoon and evening hours.

ALTERNATE OUTCOMES: Storms may weaken or even dissipate before moving into North/Central Texas tonight, with little to no activity making it into the area. Later this week, the position of the dry line will be key to the development of thunderstorms. Each afternoon, thunderstorms will develop to the west, and some of these storms will move east during the overnight hours. How far the clusters of thunderstorms move each night (or not) will have an influence on the storm type and progression for the next day.

CONFIDENCE: The confidence level with this forecast is below average, around a 4 on a 10 point scale.

Is rain guaranteed: No.

Is severe weather guaranteed? No.

How big will the hail be? One inch or slightly larger hail will be possible with any strong to severe thunderstorms.

Will there be tornadoes? The threat of tornadoes is low.

When will you send out another email update? An email will be sent during the day on Monday, likely in the afternoon.

How does the rest of the week look? This week will likely be an active, typical late May week in North and Central Texas. Thunderstorm chances are low this afternoon through Tuesday but increase starting Thursday.

Please don't hesitate to contact us if you have any questions or concerns.

Thanks,

Matt/Jennifer

To: undisclosed-recipients:
Subject: NWS Weather Briefing: Severe Weather & Heavy Rain Threats

Good afternoon,

The weather over North and Central Texas thus far this week has been quiet, but that will change as an upper level system begins to impact our region as early as this afternoon, but especially Thursday into Friday.

OVERVIEW: The big picture overview is that all of the ingredients are in place for a long duration weather event with heavy rainfall and severe weather. The uncertainty in this pattern is that pinpointing the specific times that certain locations will see hazardous weather is not yet possible. We are confident that somewhere over the eastern half of the state of Texas could see over 8 inches of rain with this event, but we are unable to determine whether that will fall in our region or farther south across south central or southeast Texas yet. Due to the unstable air in place, severe weather will be a threat at times, but favored locations and timing are also somewhat uncertain.

BOTTOM LINE: Emergency management, government officials, media, and other core emergency response partners will need to actively monitor weather forecasts through Friday evening due to the potential for significant hazardous weather including severe thunderstorms with large hail, damaging winds, tornadoes, and flooding rains. Forecast confidence is low to moderate, so significant changes may occur to the forecast quickly as the weather trends become apparent to us.

THREATS / HAZARDOUS WEATHER TYPES:

Wednesday Afternoon: Isolated supercell thunderstorms will be possible west of I-35 from 4 pm to 11 pm near and ahead of a dry line. Right now we estimate that the probability of the cap breaking is around 50% with the chance of storms near any specific location only 20 to 30%. The main threat today is very large hail, damaging winds, and locally heavy rainfall which may lead to flooding.

Alternate outcomes: 1) No storms develop at all. 2) A weakening complex of storms may arrive after midnight from southwest Texas and impact parts of Central Texas.

Thursday: Scattered showers and storms will develop during the morning hours and impact a large part of the area. The severe threat through late afternoon Thursday should be low, but not out of the question. Locally heavy rainfall may also occur, but we do not see indications of rain really focusing on any one area during the day.

Alternate outcomes: The scattered storms do not form during the morning or early afternoon Thursday (either here or down south toward the I-10 corridor). If this occurs, the severe thunderstorm potential would be greater by mid to late afternoon over the region.

Thursday Night and Friday: Severe weather and flooding rains are most likely during this time period as numerous thunderstorms or a thunderstorm complex moves into the region from the west. The complex of storms should be slow moving or result in training of storms, causing the heavy rain and flash flooding threat to increase. At this time it is difficult to tell where the heavy rain threat will set up, as it could be anywhere from North Texas to Central Texas or even Southeast Texas, but most of the data is suggesting the area highlighted in the graphic to have the greatest risk. Low level wind fields will also increase Thursday night and into Friday morning which means the tornado threat will also increase. In addition, hail and strong wind gusts will be possible with the strong to severe storms. This round of storms should gradually shift east and southeast during the day Friday with some re-development of severe storms possible on the backside. The entire system should shift east of the region by Saturday morning, which means rain and storms should end from west to east Friday afternoon and evening.

Alternate outcomes: 1) The complex of storms never develops on Thursday night west of us and therefore the heavy rain threat would be lower. However there would be more energy and dynamics for a more significant severe weather episode during the day Friday over the entire region. 2) The complex of storms Thursday night takes a more southerly route (along the I-10 corridor) which would limit or end both the severe weather and heavy rain potential for our area Thursday night and all Friday.

CONFIDENCE: The confidence level with this forecast is moderate, about a 4 on a 10 point scale.

Is rain guaranteed by Friday night: Not guaranteed everywhere, but it is very likely.

Is severe weather guaranteed? No.

Are tornadoes possible? Yes.

Tornadoes at night, isn't that unusual this time of year? Yes, it's unusual, but the high moisture (dew points in the 70s) means that the atmosphere will not need daytime heating to produce severe weather.

There are outdoor events planned Friday evening, will they be impacted? It is probable that the rain event will be over (especially for western areas) however confidence is very low and contingency plans may be needed at this time. If the widespread storms do not occur Thursday night, it increases the risk of severe weather Friday afternoon and evening.

What about the rest of the Memorial Day weekend? Low chances of storms return Saturday night through Monday. No big storm systems to worry about, but localized severe weather may still be possible. More info on this later.

When will you send out another email update? Thursday afternoon.

Please don't hesitate to contact us if you have any questions or concerns.

Thanks,

Ted

From down New Braunfels way, the South Texas NWS…

jbd/vex

From: paul.yura@... [mailto:paul.yura@...] On Behalf Of SR-EWX Alert - NOAA Service Account
Sent: Thursday, May 26, 2016 15:28
To: undisclosed-recipients:
Subject: Weather Update 315 PM, Flash Flood Watch issued for portions of the area.

Good afternoon South Central Texas Partners,

Headline:

...Flash Flood Watch in effect until 6 AM Friday for the eastern half of South Central Texas, does include San Antonio and Austin metros area....(see attached graphic)

...Severe Thunderstorms Possible this afternoon through Friday...

Area of Concern:

Severe Thunderstorms....all of South Central Texas.

Flash Flooding...Eastern half of South Central Texas....generally along and east of Highway 281. Flash Flood Watch in effect for Burnet, Blanco, Kendall, Bexar, Comal, Hays, Travis, Williamson, Lee, Bastrop, Caldwell, Guadalupe, Wilson, Karnes, DeWitt, Gonzales, Lavaca, and Fayette Counties.

Threats & Impacts:

Tornadoes: A few tornadoes possible on This afternoon through Friday

Winds: Wind gusts 60+ MPH.

Hail: Generally up to 2 inches in diameter.

Rainfall: Average rainfall amounts of 1 to 3 inches with local amounts of 6 inches.

Timing and Overview:

Daytime heating, outflow boundaries, and an upper level disturbance will be giving the area plenty of triggers over the next 36 hours. This will keep a severe thunderstorm threat as well as a flash flood threat through this time period. A Flash Flood Watch has been issued for roughly the eastern half of South Central Texas until 6 AM Friday and includes the counties roughly along and east of Highway 281.

Three different waves of storm activity are possible through Friday. One area of storms is ongoing right now this afternoon mainly across north and northeast sections of the area, north of the San Antonio area...but includes the Austin area. Storms over West Texas and northern Mexico are forecast to intensity this evening and overnight, possibly pushing into the far western areas this evening and overnight. The atmosphere wont change much on Friday, and along with daytime heating and left over outflow boundaries, more storms will likely be triggered mainly Friday afternoon and evening.

Its hard to pinpoint any one location that will receive the most rainfall over the next few days. Everybody should keep a high level of "weather awareness" during this time frame and even into the Holiday weekend as a chance for thunderstorms will remain into early next week.

Please stay tuned for future updates.

Confidence:

Hail: Moderate

Winds: Moderate

Rainfall: Moderate to High

Tornadoes: Low

Timing: Moderate

To: undisclosed-recipients:
Subject: NWS UPDATE: Severe Thunderstorm Potential - Thursday / Friday

Good afternoon,

For a while now, we have been talking about the increased potential for heavier thunderstorms on Thursday and Friday, and we are already dealing with some thunderstorms currently. Confidence continues to increase in the potential for multiple rounds of thunderstorms, including the potential for severe thunderstorms today, tonight, and Friday. Additionally, the potential for heavy rainfall producing thunderstorms already exists (portions of Robertson County, for example, have already received 3-5" of rain this morning) Several rounds of thunderstorms are expected to continue today, tonight, and Friday before moving out for the weekend. A short PDF has been attached to show the areas depicted and additional details.

BOTTOM LINE: Emergency management, government officials, media, and other core emergency response partners should be prepared for the likelihood of scattered severe thunderstorms today, tonight, and Friday. Outdoor event organizers should review their lightning and/or hazardous weather plans today for possible use. Public safety and transportation officials should also be prepared for the potential of urban and/or flash flooding, especially in traditional flood prone areas.

THREATS / HAZARDOUS WEATHER TYPES: A multi cell cluster of thunderstorms is ongoing in portions of eastern Central Texas, where radar is estimating 4-5" of rain has already fallen. area today. Robertson County is already experiencing some flooding. While all types of severe weather are in play today, the risk is highest for flooding, then hail, damaging winds, and tornadoes.

Implied possible threats for thunderstorm types:

Single Cells: Heavy rain, hail, potential for damaging winds

Multi Cells: Larger area of heavy rain and flooding, larger hail, and damaging winds .

Squall Lines Widespread damaging winds, large hail, heavy rain and flash flooding. Low potential for tornadoes
Supercells: All severe weather risks, including damaging hail, tornadoes, and flash flooding.

LOCATIONS, AMOUNTS, AND TIMING: Please see the attachment for details. Robertson County is under a Flash Flood Warning, and there is a Flash Flood Watch in effect south of a line from Goldthwaite...to Hillsboro...to Athens. (as of 12:22 PM Thursday) Severe thunderstorms, including the potential for larger than golf ball sized hail, tornadoes, and damaging winds are possible across the bulk of the area. The highest risk for severe thunderstorms appears to be along or west of U.S. 281 this afternoon, before thunderstorms move eastward during the evening and overnight hours.

ALTERNATE OUTCOMES: We are certain about the large scale features - there is plenty of available moisture, large scale lift, and instability to produce thunderstorms. There is also enough low level wind shear to produce severe thunderstorms. What is less certain is the availability of low level lift (small scale boundaries, etc.)

CONFIDENCE: The confidence level with this forecast is moderate to high, about a 7-8 on a 10 point scale.

Is rain guaranteed: Pretty close to it. Some areas will get shut out. Others will have much more rain than they want.

Is severe weather guaranteed? No. However, we will likely be issuing some warnings later today/tonight.

The timing slides show no rain in my area, so I'm fine? No. That is a model forecast that shows us the type of thunderstorms. In this case, isolated supercells and multi cell storms congealing into a complex of storms overnight

How big will the hail be? Largest hail will be bigger than golf balls, likely west of 281 through this afternoon / early evening.

Will there be tornadoes? Tornadoes are possible.

When will you send out another email update? An email will be sent during the day on Friday. We will shoot to have one out early in the day.

We have an outdoor event scheduled, how is it looking? Have a plan B. Severe weather, or thunderstorms in general, will not be continuous through Friday, but they will be in the area.

Please don't hesitate to contact us if you have any questions or concerns.

Thanks,

Mark

Subject: NWS UPDATE: Memorial Day Weekend and Beyond

Good afternoon.

Good news and not so great news today. The good news is the rain will slowly end today and much of the weekend will be ok. Rain and thunderstorm chances return to the forecast for Memorial Day and for much of next week. A short PDF has been attached to show some additional details. On some mobile devices, the attachment may not open properly.

BOTTOM LINE: Additional scattered thunderstorms and rain will slowly end from west to east today. Some lingering flooding issues will remain today. Chances for rain and/or thunderstorms will decrease (but never go away completely) through the remainder of the day. While much lower than yesterday, there is a possibility of isolated severe thunderstorms today.

THREATS / HAZARDOUS WEATHER TYPES: Isolated multi cell thunderstorms are possible to redevelop this afternoon. Otherwise, the existing showers / storms will continue as is. As the thunderstorms and rain shield moves east, there will be a risk of gusty winds, to around 40-45 mph along the back end of the rain.

Possible threats implied by thunderstorm types:

Single Cells: Heavy rain, hail, potential for damaging winds

Multi Cells: Larger area of heavy rain and flooding, larger hail, and damaging winds .

Squall Lines Widespread damaging winds, large hail, heavy rain and flash flooding. Low potential for tornadoes
Supercells: All severe weather risks, including damaging hail, tornadoes, and flash flooding.

LOCATIONS, AMOUNTS, AND TIMING: Generally, showers and a few thunderstorms will be east of I-35/35W and south of I-20. Widely isolated thunderstorms will be possible on Saturday, but rain chances return on Sunday and Monday...and much of next week.

ALTERNATE OUTCOMES: The position of the dry line will be key to the development of thunderstorms each day, starting Sunday. Each afternoon, thunderstorms will develop out west, and some of these storms will move east during the overnight hours. How far the clusters of thunderstorms move each night (or not) will have an influence on the storm type and progression for the next day.

CONFIDENCE: The confidence level with this forecast is high, about a 8 on a 10 point scale.

When will you send out another email update? This is the last email for this round. There may be another email update on Sunday, in advance of next week.

Please don't hesitate to contact us if you have any questions or concerns.

Thanks,

Mark

To: undisclosed-recipients:
Subject: NWS UPDATE: Another Week for Multiple Chances for Rain/Storms

Good afternoon,

This week will be another week to watch carefully in North and Central Texas. The remainder of today will be mixed, with a good amount of sunshine and chances for isolated to scattered thunderstorms developing in the west and southwest. Expect a repeat on Memorial Day, with a cluster of storms expected during the overnight and early morning hours, followed by improving conditions through the day. By midweek, the next system will move into Texas and remain for a few days, giving a widespread chance for rain/heavy rain. A short PDF has been included to show additional details.

BOTTOM LINE: Widespread chances for severe thunderstorms will be limited (in coverage) this week, with locally heavy rainfall becoming more of a concern by mid week. Emergency Managers, public works/transportation, and elected officials should be prepared for the possibility of localized flooding by the middle part of the week. Please continue to monitor National Weather Service forecasts, discussions, outlooks and graphics to better refine the forecast through mid-week.

THREATS / HAZARDOUS WEATHER TYPES: Isolated multi cell thunderstorms are possible each afternoon, especially to the west of US281 today and Memorial Day. Each night, these thunderstorms are expected to form into a complex of thunderstorms, moving eastward and will die out in or near the I35 corridor. Slow moving multi cell clusters of thunderstorms return Tuesday night / early Wednesday.

Implied possible threats for thunderstorm types:

Single Cells: Heavy rain, hail, potential for damaging winds

Multi Cells: Larger area of heavy rain and flooding, larger hail, and damaging winds .

Squall Lines Widespread damaging winds, large hail, heavy rain and flash flooding. Low potential for tornadoes
Supercells: All severe weather risks, including damaging hail, tornadoes, and flash flooding.

LOCATIONS, AMOUNTS, AND TIMING: The highest likelihood of heavy rainfall and/or flooding potential in North / Central Texas will occur Tuesday night and Wednesday. Until then, there will be pockets of strong to severe thunderstorms, mainly west of US 281, with a few storms outside of this are. During the next three or four days, it will not be raining just as often as it will be raining. Like the past several events, the amount of rainfall will be secondary to the rate of rainfall.

ALTERNATE OUTCOMES: We remain certain that most of the factors will be in place this week. Today: there is plenty of available moisture and instability, with wind shear being a limiting factor (especially for severe thunderstorms). By the middle part of the week, the severe weather potential is relatively low for this time of year, as the wind shear remains unfavorable. As the wind shear remains low in the middle part of the week, this increases confidence in the forecast for slow moving storms, and the ability for such storms to produce quite a bit of rainfall over a short distance. Where the storms develop exactly will be determined by remaining outflow boundaries, surface fronts, upper level features, etc.

CONFIDENCE: The confidence level with this forecast is moderate, about a 5 or 6 on a 10 point scale.

Is rain guaranteed: No.

Is severe weather / flooding guaranteed? No.

How big will the hail be? Hail is expected to be less than golf ball sized today and tomorrow, if it happens at all.

Will there be tornadoes? The tornado potential is low.

When is the highest risk for flooding? Most likely late Tuesday and Wednesday for North & Central Texas.

What areas are most likely to flood? IF the forecast holds as we think it will: The Trinity could see minor flooding, as well as the Brazos, Red, and Leon Rivers and their basins.

When will you send out another email update? Another email is possible on Monday, but emails will definitely return Tuesday.

Please don't hesitate to contact us if you have any questions or concerns.

Thanks,

Mark

Sent: Wednesday, June 01, 2016 05:11
To: undisclosed-recipients:
Subject: Heavy Rainfall and Flash Flood Potential Continues Today - Thu Night

Good Morning South-Central Texas Partners,

Headline:

...Flash Flood Watch in effect for All of South Central Texas through Thursday Night....

...Rounds of Storms with Locally Heavy Rainfall Will Continue the Flash Flood Threat...

Area of Concern:

All of South-Central Texas.

Threats & Impacts:

Rainfall: Widespread rainfall amounts of 3 to 5 inches, with isolated pockets up to 10 inches.

High Flood & Flash Flood Impacts: Some locations may experience major flooding with flood waters capable of causing rivers and tributaries to overflow their banks in several places. Small streams, creeks, canals, ditches, and low water crossings could become dangerous rivers with flood waters. Widespread inundation of both primary and secondary roads with some long term closures are possible. Flood waters may prompt evacuations and road closures, and could require rescues.

Hail, Winds, Isolated Tornadoes: Low risk and impact, but some severe thunderstorms are possible during the period. Will not be our biggest problem.

Timing and Overview:

The weather pattern continues to point toward significant flash flooding across South Central Texas sometime today through Thursday night. A slow moving upper low will enhance the storm threats, and with the rain that has already fallen the past week heightened awareness from all South-Central Texas residents and partners is very important. Please stress Turn Around Don't Drown.

There will be at least two more rounds of storms, one potentially today into tonight and another Thursday into Thursday night. There is lower than normal confidence on the exact timing and placement of these rounds of storms. Additional rain totals today through Thursday night could average 3 to 5 inches with pockets up to 10 inches. Most area lakes are now full and the continued flow into the lakes will only increase the flooding threat. A bullseye of high rain totals can develop quickly, and if in the wrong place at the wrong time can bring significant impacts. Much of Texas is under a Flash Flood Watch so resources may be stretched. The flooding threat continues to be regional to state wide in scope.

Confidence:

Flash Flooding and River Flooding...High

Severe Thunderstorms...Low to Moderate

Timing...Low to Moderate

Additional Information Resources:

Tips and Facts: (For use in PIO, Social Media, etc):

* Turn Around, Don't Drown. South Central Texas is known as Flash Flood Alley.

* In South Central Texas we lose more people to flash flooding than any other weather hazard.

* Do not drive around barricades, its against the law, plus its deadly.

* Driving at night in heavy rain is particularly dangerous. The majority of our flash flood fatalities occur in vehicles while driving at night.

* In these conditions, flooding and road closures will continue days after the rainfall has ended.

* Be "Weather Aware" through the remainder of the Memorial Day weekend and into the work week

* Any given day or night this week, thunderstorms may form and quickly produce 2-3 inches of rain in less than an hour.

* With the start of the summer recreational activities and increased flows in area creeks and rivers, outdoor enthusiasts such as campers, kayakers, tubers, etc will be at greater risk. During these strong flow conditions head the warnings and closures that local officials have in place.

More safety and TADD information can be found on...http://www.floodsafety.noaa.gov/

* NWS Austin / San Antonio Contact Numbers: 800-292-5508 <tel:888-579-9731> or 830-606-3617 <tel:361-289-0725>

Subject: NWS UPDATE: Heavy Rainfall and Flooding Threat Through Monday

General Public Information

Good morning Partners,

Significant changes are still on the way for North and Central Texas this weekend, punctuated by cooler temperatures (by August standards, at least), and a good chance of rain area-wide. A cold front will sweep southward into Central Texas by Saturday morning, then stall. This feature, coupled with abundant moisture and the presence of an upper level disturbance approaching from Louisiana, will create the potential for flash flooding, particularly during the Sunday night through Monday time frame. However, isolated flash flooding may also occur Saturday through Sunday especially with slow moving showers and storms.

ALSO: With abundant heat and instability in the atmosphere today, any thunderstorms that form this afternoon will have the potential to produce isolated damaging downburst winds. The chances for winds like this DO increase when afternoon temperatures rise above 100 degrees.

Click on the attached PDF for additional graphics and details.

Threats/Hazardous Weather Types

The threats/hazardous weather types are:

* Heavy rainfall and flash flooding - particularly in urban areas and other flood-prone spots

* Isolated strong to severe thunderstorms today and Saturday, producing damaging downburst winds

* Cloud to ground lightning from scattered to numerous thunderstorms

Locations and Amounts

The locations and amounts are:

Widespread 1-3" across the region through Monday with isolated higher amounts near 4-5". The best chance of these higher amounts will be along and east of the Interstate 35/35E corridor.

Timing

The timing is:

Confidence

Our confidence level for this forecast is:

FAQ

Is rain guaranteed? We're confident that virtually every location in North and Central Texas will see at least a little rain through Wednesday. Many locations - but not all - will pick up a decent rain this weekend through Monday morning.

Will there be tornadoes? Tornadoes are not expected, but we can't rule out some isolated damaging wind gusts today and Saturday with some of the stronger storms.

When will you send out another email update? We will send out another update Saturday.

Emergency Manager, Media, and Storm Spotter Information

Bottom Line

We anticipate isolated to scattered showers and thunderstorms to develop across North and Central Texas later this afternoon, with better chances west of Interstate 35/35E. Additional showers and storms are expected to spread south and eastward across the region later tonight and Saturday. Thunderstorms should become more widespread late Sunday through Monday morning, particularly over eastern North Texas where moisture and lift will be maximized. Precipitation chances will linger across most of the region through the middle of next week. Daytime temperatures will drop below seasonal norms on Sunday, and continue below average through the upcoming week.

With a very moist airmass in place, and a slow storm movement expected, the threat for heavy rainfall and localized flash flooding does exist. Right now, our confidence in the location and timing of any flash flooding is not that great. However, we DO think the threat will be maximized east of Interstate 35/35E from Sunday evening through Monday morning.

A low-end threat for isolated flash flooding may also exist Saturday through Sunday afternoon, if scattered slow-moving storms develop as expected in the moisture-rich airmass. As is often the case, urban/built up areas, and those locations with chronic drainage problems will face the greatest threat this weekend and Monday.

Alternate Outcomes

This system is still unfolding, so any number of scenarios may emerge. For example:

* The timing of the system may slow down, and the heavy rain/flooding threat may extend into Tuesday.

* The upper level forcing associated with this event converges a bit farther east than expected (closer to the Louisiana border), limiting the heavy rainfall potential for ALL areas of North Central Texas. This could happen.

* The dynamics associated with this storm system may be stronger than we expect right now, and develop farther west. If so, we'll get more rainfall - falling more intensely and producing more widespread flash flooding - than we're currently anticipating. This is also possible, but much less likely.

If you have any questions, please contact us at:

Subject: NWS UPDATE: Rain Trends and Threats Through Early Next Week

General Public Information

Good afternoon partners,

Our long awaited cold front has now swept southward through all of North and Central Texas, bringing clouds and cooler temperatures. This is a trend that will actually continue through the weekend and even into the latter part of the upcoming week. We're now seeing a change in the rainfall forecast thinking, in that widespread, heavier precipitation is no longer likely to occur in the near-term.

We do expect scattered showers and thunderstorms to develop this afternoon and re-occur Sunday through at least Friday, particularly southeast of a Paris to Lampasas line where moisture is more abundant. Through this period, brief heavy rainfall may still occur on an isolated basis - particularly south of the line just mentioned. If the heavy rain falls in urbanized or poorly drained areas (e.g., construction zones), we could see some localized flooding issues. However, at this time, we don't believe there's a threat of serious flash flooding with this current and evolving pattern.

There still remains quite a bit of instability in the atmosphere across Central Texas today, so any thunderstorms that form this afternoon will have the potential to produce isolated damaging downburst winds.

Click on the attached PDF for additional graphics and details.

Threats/Hazardous Weather Types

The threats/hazardous weather types are:

* Cloud to ground lightning from scattered thunderstorms - mainly southeast of a Lampasas to Paris line this afternoon and through the week

* Isolated heavy rainfall and possible localized flooding issues

* Isolated downburst winds (mainly this afternoon)

Locations and Amounts

The locations and amounts are:

Areas of 1 to 2" rainfall through Tuesday, mainly southeast of a Lampasas to Paris line. Lesser, scattered amounts north and west of that line.

Timing

The timing is:

Confidence

Our confidence level for this forecast is:

FAQ

Is rain guaranteed? Areas south and east of a Paris to Lampasas line still have a really good shot at some rain from today through the end of the upcoming week. However, for those points north of this line, the rain will be more hit and miss. In these areas, if you didn't receive rain Friday afternoon/evening, you may not necessarily get any more with this current pattern.

Why are we no longer expecting (widespread) heavy rainfall? The track of the low pressure system is now to our east, keeping the best lift for widespread heavy rains to the east of North and Central Texas. The front has also pushed farther south quicker than expected.

Will there be tornadoes? Tornadoes are not expected, but we can't rule out some isolated damaging wind gusts with any of the stronger storms this afternoon.

When will you send out another email update? This will be the last update on this system, unless the forecast changes unexpectedly.

Emergency Manager, Media, and Storm Spotter Information

Bottom Line

Scattered thunderstorms are still possible across much of North and Central Texas, but the overall threat of flash flooding has decreased. The best chance of rain will remain southeast of a Paris to Lampasas line through mid-week, and it's in these areas where we'll continue to see a low-end threat for isolated heavy rainfall and localized flooding. A lightning threat will continue, however, across most of the region, due to expected widely scattered to scattered thunderstorms each day.

Alternate Outcomes

Our confidence in the evolution of the forecast is increasing now. However, there are still a couple of alternative scenarios:

* The airmass remains very moist over much of the region. As a result, any very small-scale boundaries that do manage to form in the heat of the afternoons could generate smaller, yet more organized clusters of thunderstorms that yield flash flooding over the scale of a county or two. This is unlikely to happen, but still possible. It's very difficult to pinpoint the development of these small systems more than a few hours in advance.

* Drier air may work deeper into North and Central Texas later this weekend and early next week, sharply diminishing the potential for any thunderstorm development each day. This is also less likely to happen, but possible.

Sent: Sunday, August 14, 2016 06:17
To: undisclosed-recipients:
Subject: Locally Heavy Rainfall Possible Today through Tuesday

Good Morning South-Central Texas Partners,

Headline:

...Scattered to Numerous Showers & Storms Today through Tuesday...

...Locally Heavy Rainfall Possible...

Timing and Area of Concern:

Much of South-Central Texas, with the locally heavy rainfall threat greatest Today through Tuesday.

Threats & Impacts:

Rainfall: 2-4 inches of rain is likely across much of South-Central Texas today (Sunday) through Tuesday. Some pockets up to 8 inches will be possible.

Flooding: We could begin to see some localized flash flooding concerns today, with the potential for flash flooding possibly increasing tonight through Monday night. At this time, main stem river flooding is not anticipated to reach moderate or major levels, but some could reach action or minor flood stage.

Timing and Overview:

A pattern change has taken place across South-Central Texas and a very moist airmass is now in place. Disturbances will generate scattered to numerous showers and storms today with the potential for some localized pockets of heavy rainfall.

Chances for more widespread showers and storms producing locally heavy rainfall are forecast to increase tonight through Monday night across South-Central Texas, potentially leading to greater flash flooding concerns. At this time computer models are having a difficult time determining exactly where the heaviest rainfall will occur, but it does appear there will be a threat somewhere over the region during this time.

It should also be noted that there exists the potential for night time heavy rainfall and flooding tonight and again Monday night.

Despite the area being relatively dry recently, atmospheric conditions are currently in place to produce rainfall rates that could lead to flash flooding. Rainfall rates could easily reach 2-3 inches per hour in heavier storms. Please stay closely tuned to the forecast over the next 48 hours.

Confidence:

Moderate

To: undisclosed-recipients:
Subject: Locally Heavy Rainfall Possible Today through Wednesday

Good Morning South-Central Texas Partners,

Headline:

...Locally Heavy Rainfall Possible Today Through Wednesday...

...Flash Flood Watch for Most Areas Until 7 PM Today...

Timing and Area of Concern:

Locally heavy rainfall threat greatest today across most of the Hill Country and along and east of I-35.

Threats & Impacts:

Rainfall: For today, an additional 1 to 3 inches of rain is likely, with isolated pockets up to 4 inches.

Flooding: Localized flash flooding of creeks, streams, low water crossings and urban areas is likely the biggest concern today. At this time, main stem river flooding is not anticipated to reach moderate or major levels, but some could reach action or minor flood stage.

Overview:

A very moist air mass remains in place today and numerous showers and some scattered thunderstorms are expected. Given the amount of moisture in place with a coastal front and upper level disturbance, locally heavy rainfall can be expected from any thunderstorms and even some of the stronger showers. The greatest threat for locally heavy rainfall today will be across the Hill Country and along and east of I-35. A Flash Flood Watch is in effect today for counties along and east of U.S. Highway 83.

The Flash Flood Watch may need to be extended into the overnight hours and tomorrow depending on how much rain occurs today and any circulations and boundaries left behind to help focus additional storm development. Another round of scattered to numerous showers and storms are in the forecast for south central Texas on Wednesday.

Atmospheric conditions are currently in place to produce rainfall rates that could lead to flash flooding. Rainfall rates could easily exceed 2 inches per hour in heavier storms. Please stay closely tuned to the forecast over the next 24-36 hours.

Confidence:

Rainfall: High

Flooding: Moderate

To: undisclosed-recipients:
Subject: Locally Heavy Rainfall Possible Through This Evening

Good Morning South-Central Texas Partners,

Headline:

...Locally Heavy Rainfall Possible Through This Evening...

...Flash Flood Watch for Most Areas Until 7 PM Today...

Timing and Area of Concern:

Locally heavy rainfall threat greatest today across most of the Hill Country and along and east of I-35. The threat decreases across these areas later tonight while increasing in the Rio Grande Plains and Edwards Plateau overnight.

Threats & Impacts:

Rainfall: An additional 1 to 3 inches of rain is possible today, with isolated spots up to 4 inches.

Flooding: Localized flash flooding of creeks, streams, low water crossings and urban areas is the biggest concern today. Main stem river flooding is not anticipated to reach moderate or major levels at this time, but some may reach action or minor flood stage.

Overview:

Widespread to numerous showers and thunderstorms are expected today due to a very moist air mass and upper level disturbance over the region. Locally heavy rainfall with rain rates

exceeding 2 inches per hour will be possible with any thunderstorms and even some of the stronger showers across all of South Central Texas. The greatest threat continues to be across the Hill Country and for areas along and east of I-35 which have already received 2-8 inches with isolated totals up to 12 inches since Saturday. Thus, a Flash Flood Watch remains in effect until 7 PM this evening for counties along and east of U.S. Highway 83.

The Flash Flood Watch may need to be extended into the overnight hours for at least part of South Central Texas, including expanding it to counties farther west that are not in the current watch. Shower and thunderstorm coverage is expected to decrease across the eastern two-thirds of South Central Texas tomorrow. However, any circulations and boundaries left behind to help focus additional storm development could change this, so optimism remains muted. Storm coverage should decrease further on Friday to at least temporarily end the heavy rainfall threat.

Confidence:

Rainfall: Moderate to High Today, Low to Moderate Tonight

Flooding: Moderate

Subject: NWS UPDATE: Additional Rainfall / Flooding Potential
To:

General Information

Good afternoon,

Overall, the weather for today will be cloudy with scattered showers. A few thunderstorms are possible, but rainfall is the primary concern. The rain that is occurring today is being caused by an small, upper level disturbance which is centered between the DFW Metroplex and Waco. The heaviest rainfall we are expecting will occur this afternoon and/or evening, with scattered showers remaining through the end of the week and into the weekend. Additional average rainfall is expected to be 1-3 inches...through the end of the week. Click on the attached PDF for additional graphics and details.

Threats/Hazardous Weather Types

The main threats are (in order of likelihood):

Flooding of Urban Areas and/or Small Streams

Flash Flooding

Lightning

Locations and Amounts

See the attachment for the details, but the highest chance for heavier rainfall and flash flooding are south of Interstate 20, where the Flash Flood Watch is in effect

Timing

Confidence

Our confidence level for this forecast is:

Emergency Manager, Media, and Storm Spotter Information

Bottom Line

The bottom line for today is rain and a few thunderstorms will continue through the afternoon, tonight, and through much of the week. Rain is not expected to be continuous during the entire time. An average of 1-3 inch of rainfall is likely for much of the area. Some areas will receive less than one inch, and the heaviest amounts will be in the 3 to 5 inch range. Severe thunderstorms are not anticipated. River flooding is not anticipated at this time as well. (Small creeks will likely flood in a few areas)

Alternate Outcomes

Flash Flooding and flooding is determined more by local effects, but confidence is relatively high in the areas anticipated to receive the higher rainfall amounts.

FAQ

Is rain guaranteed? No. Some areas may stay dry.

Is severe weather guaranteed? Severe thunderstorms are not anticipated.

How much rain is needed to cause flooding? In the flash flood watch? around 2". Not in the flash flood watch? Would need 3-4"

Subject: Flash Flood Update:

Currently the only road closures reported in Bell County are Riverside Trail near Pea Ridge and Brewer Road. TXDOT reports FM 2484 at Crows Ranch Road is also closed. Numerous other roads were briefly closed throughout the day but the water quickly receded and these are the only closures we currently have. There was a report of one home that was flooded with a few inches of water on Woodland Point near Lake Belton but damage was minor. Rain continues to train through the county and additional impacts are possible throughout the evening. We will keep you updated if situation worsens but thus far things are not too bad. Please keep this office informed if your agency or jurisdiction has storm related impacts.

Regards,

Michael Harmon

Greetings All -

The Central Texas Amateur Radio Net heard every Thursday evening over the N5ZXJ repeater, is in need of a Net Control Operator. Due to life's commitments, Hal Pagel-N5JLL has asked to step down from his net control position and now we need someone to step up and fill his shoes. I can promise your commitment in this endeavor will be greatly appreciated.

Those interested should contact Kenneth Watkins-KE5ISN via email at: ke5isn@aol.com <mailto:ke5isn@...> or by phone at: (254) 721-6530.

Early morning update from EWX…

jbd/vex

From: Nick.Hampshire@... [mailto:Nick.Hampshire@...] On Behalf Of SR-EWX Alert - NOAA Service Account
Sent: Saturday, August 20, 2016 02:00
To: undisclosed-recipients:
Subject: UPDATE: Flash Flood Watch in effect for portions of South-Central Texas

Good morning South-Central Texas Partners,

Headline:

Heavy Rainfall with Flash Flooding Possible today through Monday Across the Rio Grande Plains, Edwards Plateau, and Hill Country.

A Flash Flood Watch is in effect for areas west of a Georgetown to San Antonio to Pleasanton line through Sunday evening.

Area of Concern:

Primary area of concern will be for locations mainly west and north of IH35.

Threats & Impacts:

Rainfall: Widespread rainfall amounts of 4 to 6 inches will be possible with isolated amounts to 10 inches through Monday morning.

Flooding: Several locations may experience moderate flooding with flood waters capable of causing rivers and tributaries to become swollen and overspill their banks mainly in historically vulnerable places. Small streams, creeks, canals, and ditches overflow with some low lying structures flooded. Inundation occur at underpasses, low-lying spots, and poor drainage areas. Some streets and parking lots take on moving water. Storm drains and retention ponds overflow. Flood waters may prompt several evacuations and road closures, especially at popular picnic or camping locations

Timing and Overview:

Heavy rain is ongoing across Val Verde County at this time with some locations already picking up over 5 inches of rain. A frontal boundary, upper level disturbance, and a moisture laden atmosphere will continue to produce prodigious amounts of rain with as much as 10 inches in localized spots occurring through Monday morning. The heavy rain threat will be confined to areas closer to the Rio Grande over the next few hours before spreading to the east by tonight. Overall, the most likely location for the heaviest activity will be west and north of IH35 across portions of the Rio Grande Plains, Edwards Plateau and

portions of the Hill Country.

Confidence:

- Rainfall Amounts: Moderate to High

- Flooding: Moderate to High

Sent: Thursday, September 22, 2016 14:37
To: undisclosed-recipients:
Subject: NWS UPDATE: Weekend Pattern Change & Rainfall

General Information

Good afternoon,

This will be a fairly short and sweet update, and won't be one with a lot of detail. There are no graphics attached for this email.

By the weekend, the pattern will shift to allow cooler air and rain into part of North and Central Texas. Rain chances will increase through the day on Saturday, and rain chances increase on Sunday and linger into early next week. While most of us will welcome the rain, a few of the strongest storms could produce locally heavy rainfall and some strong gusty winds can't be ruled out on Saturday.

Threats/Hazardous Weather Types

The main threats are:

Lightning

Strong gusty winds mainly on Saturday

Urban and small stream flooding

Flash Flooding

Locations and Amounts

The entire area will likely see rain, with most areas receiving between 2 and 4 inches from Saturday through Tuesday.

Timing

No issues from rainfall/thunderstorms expected today or Friday. On Saturday, we do expect some scattered thunderstorms to develop, but the majority of the rain and heavy rain will be on Sunday, and into early Monday.

Confidence

Our confidence level for this forecast is low:

Emergency Manager, Media, and Storm Spotter Information

Bottom Line

The bottom line for today is to be ready for the potential for localized heavy rainfall late in the weekend and potentially lingering into the middle of next week. Severe weather is not anticipated. Rain and/or heavy rain will be the primary issue.

Alternate Outcomes

Won't lie: this forecast is far from certain and the details will likely change a few times before Sunday.

FAQ

When will you send out another email update? We will shoot for a more detailed email on Friday, before Noon.

Mark

6005. FW: Locally Heavy Rainfall Sunday and into Monday *** Could be a wet winter***

Yahoo group: Temple_ARC
Date: 2016-09-23 16:36:36 UTC
From: Joe Dorn
Topic: 6005 Message: 6005
Attachments: 1 described; binary payloads are missing from this source WARC

This is from Aus/SA

My mentor when I was running cattle was C.A. Smith, long time Belton AG teacher… C.A. passed on this bit of wisdom which I have found to be fairly accurate…

“If the first cold front of the season is wet then we will have a wet winter and if dry, then a dry winter.”

We have already had one minor wet cold front, and now this one is on the way…

Break out the snow shoes…

To: undisclosed-recipients:
Subject: Locally Heavy Rainfall Sunday and into Monday

Good Morning South-Central Texas Partners,

Headline:

...Locally Heavy Rainfall Possible Sunday Through Monday Mainly West of the I-35 Corridor...

Area of Concern:

Highest Threat is along and west of the I-35 Corridor. This includes the Austin/San Antonio Metro Areas, Hill Country, Rio Grande Plains, and Edwards Plateau regions.

Threats & Impacts:

Rainfall:

East of I-35: Around an Inch.

West of I-35: 3-5 inches with isolated locations exceeding 6 inches.

Impacts:

Several locations may experience minor flooding with flood waters capable of causing small streams, creeks, canals, and ditches to become swollen and overflow in a few places, but with little to no property damage. Quick ponding of water occurs at underpasses, low-lying spots, and poor drainage areas. Storm drains and retention ponds become near-full and begin to overflow in a few places. Flood waters may prompt brief road closures.

Timing and Overview:

An upper level low and cold front will bring rain to much of the area Sunday and Monday. The highest chances of rainfall will be Sunday night with the greatest coverage west of I-35. Rainfall amounts around 3-5 inches will be possible in some locations west of I-35. Uncertainty does exists with this forecast as the exact future track of the upper low is unknown and future adjustments to this forecast is likely.

Confidence:

Locally Heavy Rainfall: Medium

Area of Highest Rainfall: Low

We are dry and will welcome the rain…

jbd/vex

From: Mark Fox - NOAA Federal [mailto:mark.fox@...]
Sent: Friday, September 23, 2016 10:26
To: undisclosed-recipients:
Subject: NWS UPDATE: Weekend Rain and Locally Heavy Rain

General Information

Good morning,

Confidence is increasing that the end of the weekend will include widespread rainfall and periods of locally heavy rainfall. Highest rainfall amounts are expected to be west of I-35/35W. An approaching system will increase rain chances through the weekend, with the later parts of the weekend having the highest chances for rain. See the attached PDF for additional graphics and details.

Threats/Hazardous Weather Types

Today: hot temperatures, isolated thunderstorms with lightning as the primary threat.

Saturday: Isolated to scattered thunderstorms. Severe weather not anticipated. Lightning and gusty winds are the primary concern from thunderstorms.

Saturday Night through Sunday Night: Rain and Thunderstorms. Locally heavy rain may cause urban and/or small stream flooding.

Locations and Amounts

All of the area should receive some rain this weekend. Most of it will occur late Saturday, Sunday and Sunday night. Highest rainfall amounts and any potential for urban/small stream or flash flooding will be in the west.

Timing

Isolated thunderstorms are possible this afternoon to around sunset. Rain chances increase through the afternoon hours on Saturday and remain through Sunday evening.

Confidence

Our confidence level for this forecast is moderate to high and increasing.

This bar represents the overall confidence in the weather forecast. We are quite confident in the forecast for rain, with pockets of heavy rain. Widespread flooding is not anticipated. Severe weather is not anticipated.

Emergency Manager, Media, and Storm Spotter Information

Bottom Line

The bottom line is the weekend will contain periods of rain and heavy rainfall. Widespread flooding or severe weather is not anticipated. High rainfall rates will be the determining factor whether or not any place receives flooding.

Alternate Outcomes

Confidence is high in the weather pattern. Most of us will see rainfall over the weekend.

If the upper level system changes speed, the timing of the heavy rain will be different than what we show here.

FAQ

Will we see rain? yes.

Will there be severe thunderstorms? severe thunderstorms are not anticipated

Will there be flooding? There may be a few areas with flooding issues.Flooding is expected to be localized, not widespread.

6012. We need 6 VE's for the CTARC meeting Tuesday

Yahoo group: Temple_ARC
Date: 2016-10-03 01:01:52 UTC
From: Joe Dorn
Topic: 6012 Message: 6012

We need 6 VE's for the CTARC meeting Tuesday. I am going to have to have two separate test sessions.

This should be covered by CTARC members with no problem. I already have 4 committed. Jan, Gil, Gerald and me.

The tests will be in two separate rooms since one will require reading of the test.

To: undisclosed-recipients:
Subject: NWS UPDATE: Severe Thunderstorm Potential - Tuesday

General Overview

Good morning,

We continue to watch a strong storm system which will move quickly across North and Central Texas this afternoon and evening. The cold front itself is still located well to the north, in western Kansas. There is a dry line which stretches across the Texas Panhandle as well as West Texas. This dry line and front will move east during the day today and is expected to produce a line of thunderstorms beginning late this afternoon and continuing through the evening. While the main hazard will be lightning and strong winds, there appears to be enough instability and low level wind shear to produce rotating storms, increasing the potential for tornadoes. Please click on the attached PDF for additional graphics and details.

Threats/Hazardous Weather Types

The threats/hazardous weather types are (in order of likelihood):

* Lightning
* Localized heavy rainfall
* Severe Thunderstorms

* damaging winds
* isolated tornadoes
* hail
* flash flooding

Areas of Concern

The primary areas we are concerned about for severe thunderstorms are generally east of I-35/I35E.

For localized heavy rainfall, the area is east and south of a line from Waco/Temple to Emory. Please see the attached images for a better description of the areas of concern.

Expected Timing

The timing is:

Forecast Confidence

Our forecast confidence level for this forecast is:

FAQ

Is rain guaranteed? No. In fact, most of us will not see rain.

Is severe weather guaranteed? No. Only a few, unlucky folks will see severe thunderstorms on Tuesday.

How big will the hail be? If a thunderstorm is tall enough to produce hail, the hail is expected to around 1" (Quarter sized)

Will there be tornadoes? Tornadoes are possible, especially if discrete storms can develop ahead of the line.

How much rain until flooding becomes a concern? In general, it would take around 3" of rain to get decent runoff. Also in general, amounts over 4" would begin to cause flooding issues.

When will the next email update be sent? This is the last email for this event.

What about the rest of the week? This is the main system of concern for this Holiday week. There will be another shot of rain or thunderstorms on Friday, but severe weather is not anticipated.

Whats the longer range outlook? Confidence is increasing for the potential for cold temperatures during the first week of December (late next week).

Emergency Manager, Media, and Storm Spotter Information

Bottom Line

The bottom line is there will be some active weather this evening and tonight. Monitor National Weather Service forecasts and graphics for tactical information about this storm system. The current thinking of this system is for the thunderstorms to develop and quickly intensify along and east of I-35/35E during the early evening hours. This means the strongest thunderstorms are likely to occur during the nighttime hours, when visibility of hazards could be an issue.

At the present time, there are no plans for a special weather balloon launch at the office, but we have asked for an additional weather balloon from the College Station area. We believe the additional data between DFW, Austin/San Antonio, and Houston will give us a better idea of the atmosphere in the area of concern.

Alternate Possibilities

What we are certain of:

* Abundant moisture is in place now and will be here through the evening hours.
* Low level wind shear is plentiful and is expected to produce some severe thunderstorms
* Instability is highest along and east of I-35/35E

What we are not certain about:

* Still some concerns about the timing of the cold front. The front is now working its way to our area later than forecast yesterday - this is why the area of concern shifted slightly west and further north than yesterday.
* The strength of the upper level system - The system's upper level energy will move through after the initial boundaries (the cold front and dry line). This is expected to keep severe thunderstorms more isolated in nature and not widespread.
* Whether or not discrete storms will be able to develop ahead of the line of storms - If so, watch these carefully for rotation.

If you have any questions, please contact us through the usual means.

Forwarded to amateur radio reflectors.

Rick, please forward to the CTARC mailing list.

If you live in the Belton area, this is a very worthwhile class to attend..
After you complete the class you become eligible to join the C.H.I.P.S
program, a citizen's police axillary that is very active in the community.

The subjects are various aspects of police activities with lots of hands-on
activities. You won't be bored.

I cannot emphasize enough the interest that the class holds through the ten
weeks (I believe it is that long.).

From: ki5m2008@...
Topic: 6017 Message: 6021

I have not seen an obituary but I do wish to mention that Ron was an active person in amateur radio.
I have seen him volunteer every year for the JOTA Boy Scouts fuctions.
Ron was a former board member, vice president of TARC, Volunteer Examiner and trustee of the W5LM repeater and club license. He is listed in the First Edition of the CTARC paper as a VE.
Ron was a former member of the Bell County operations center Reservist group.
Ron was a former member of the Texas Radio Amateur Civil Emergency services (RACES) who actually reported in every month.
I noticed on QRZ.com that he was born in 1934 and his call sign is mentioned on several websites.
I used to hear him on 1.900 MHz early in the morning.

Rest in Peace our silent key friend.

6022. Temple Christmas Parade information

Yahoo group: Temple_ARC
Date: 2016-12-04 22:45:13 UTC
From: myronmesecke@...
Topic: 6022 Message: 6022

(posted to both Yahoo groups)

Monday December 5th.

Need help for the Temple Christmas parade. We will begin meeting at 3:00 PM behind the Bell Country Health Building at 8th street and Barton Avenue.

Staging starts at 4:00 PM. The intersection of 8th and Adams will close at this time.

Even if you can't make it until 5:00 PM you are still needed.

Parade starts at 6:30 PM. Staging area should be clear by 7:30 PM.

You will be able to park your vehicle at the intersections you work. That way any personal items are always at the ready.
Bring safety vest if you have one. 2 meter HT if you have one, if you don't you can still help. Bring any snacks or drink you might want. Suggested items: clipboard, pen, flashlight. Bring warm clothing and wet weather clothing if you want.

Yes, there is a good chance of rain. High on Monday will be 50.

At 9:00 AM Monday the parade committee will make its decision on whether to cancel the parade due to weather. The number to call to hear a recorded message is 254-298-5300.

If the parade is canceled it will be held on Tuesday December 6th.

If it is canceled I will post that information on the Yahoo groups. If I post it is canceled, I ask that someone local get the word out on the 146.82 repeater, around 12 noon, 2 PM and 4PM. I will be at work in Round Rock if the parade cancels.

From: myronmesecke@...
Topic: 6024 Message: 6024

Just got back from the parade meeting.

NO parade today!
Parade is rescheduled for Tuesday the 6th.
Times are the same. Meet starting at 3:00 PM. Staging begins at 4:00 PM, parade is at 6:30 PM.

Due to heavy drizzle this afternoon, forecast of light drizzle this evening the parade committee has decided to wait until tomorrow when there is no rain in the forecast. Decision was based on what is best for parade entrants, public coming out to watch the parade and those working the parade.

See everyone tomorrow afternoon.

If you previously said you would be there today but can't make it tomorrow please let me know.

If the weather prevented you from signing up to help but you are willing to work it with no rain, please let me know.

6030. I have decided to cease my activities as the VE lesion

Yahoo group: Temple_ARC
Date: 2016-12-30 00:21:06 UTC
From: Joe Dorn
Topic: 6030 Message: 6030

BCC: My VE lists

I have decided to cease my activities as the VE lesion for amateur radio testing after the February CTARC meeting. I initially started the test program in 2005 to get amateur radio operators for the RAC-L hospital network and the Bell County Emergency Operations Center.

I have had problems locating test sites since the Bell County Emergency Manager placed access restrictions on our test operations. I initially set up the testing to gain recruits for the Bell County Emergency Operations volunteer program. Apparently that support is no longer needed and I have no desire to scratch around looking for alternate test sites.

I also have land related obligations that are in conflict with the TARC Expo events.

If someone desires to take on the responsibility, I will transfer my materials and liaison designation to the person. I will be available to offer advice on the related activities. I will participate in testing as time allows. The individual must be an Extra Class amateur and an accredited ARRL VE.

If no one accepts the obligation, I will return the testing materials to the ARL VEC in early February.

I would like to thank all of the VEs that have given me outstanding support through the years.

6038. FW: Locally Heavy Rainfall & Severe Weather Possible Sunday Night into Sunday Morning

Yahoo group: Temple_ARC
Date: 2017-02-19 01:24:09 UTC
From: Joe Dorn
Topic: 6038 Message: 6038
Attachments: 3 described; binary payloads are missing from this source WARC

This is from San Antonio/Austin NWS.

I have not forwarded a lot of the recent advisory's because I did not agree with them. The NWS totally depends on the computer readout du jour and seldom if ever correct for what mariners call 'local knowledge'. I have been closely monitoring Central Texas weather since 1985, before some of the NWS folks were born and like a farmer/rancher (I have been both) I covet every drop of rain in the summer and know what a "Blue Norther" looks like in the winter. I also know that many frontal systems change their characteristics as they approach Central Texas and the Balcones Escarpment. If I feel that the computer forecasts are significantly off, I do not forward them. I give the benefit of the doubt to the NWS but do not blindly buy their products…

I do believe that we are in for some significant rain the next several days and definitely would not want to be downstream from a dam in California.

To: undisclosed-recipients:
Subject: Locally Heavy Rainfall & Severe Weather Possible Sunday Night into Sunday Morning

Good afternoon South-Central Texas Partners,

Headline:

...Locally Heavy Rainfall Possible Sunday Night...

...Strong Storms Possible Sunday Afternoon and Sunday Night...

Timing and Area of Concern:

* Heavy Rainfall: Primarily east of Interstate 35 and I-37 Sunday Night.

* Strong to Severe Storms: Hill Country and along and east of I-35 Sunday afternoon and Sunday Night.

Threats & Impacts:

Rainfall: 1-2 inches along and east of the I-35 and I-37 corridors. Isolated amounts up to 4 inches are possible east of I-35 into the coastal plains. (Rainfall amounts around 1.5 inches are expected in the Austin Metro area, with amounts around 1 inch expected over the San Antonio Metro area.) West of I-35, less than 1 inch of rainfall is expected with amounts dropping to near 1/2 inch or less along the Rio Grande. Please reference overview and confidence sections below for uncertainty.

* Some locations could experience minor flooding with flood waters capable of causing small streams, creeks, canals, and ditches to become swollen and overflow in a few places. Flood waters may prompt brief closures of low water crossings. Some river points along the Lower Guadalupe River could experience minor flooding. Other mainstem river basins east of I-35 in South Central Texas could see points in action stage.

Hail: Up to 1 inch in diameter

Winds: Up to 60 mph

Overview:

A strong upper level disturbance will move across the region Sunday afternoon and Sunday night. There will be a low chance for showers Sunday morning with increasing rain chances and scattered thunderstorms possible Sunday afternoon. The showers and storms will become more widespread Sunday evening from the eastern Hill Country through the I-35 corridor and then transition east of I-35 overnight Sunday into Monday morning. The greatest potential for heavy rainfall looks to occur mainly east of I-35 and I-37 where 1-2 inches of rain with isolated amounts over 4 inches will be possible. The threat for heavy rainfall will move east into Southeast and East Texas by late Monday morning.

There will also be be a threat some storms could become strong to marginally severe Sunday afternoon and Sunday night. Any of these storms will be capable of producing small hail and damaging straight-line wind gusts.

Confidence:

Moderate on exact placement of heavy rainfall corridor across south central Texas. Confidence is on the increase that heavier rainfall amounts should remain east of the Interstate 35 & 37 corridors. However, please monitor forecasts closely through the holiday weekend for any potential westward shift in heavier rainfall into the I-35 corridor.

Additional Information Resources:

* NWS Austin / San Antonio Contact Numbers: 800-292-5508 <tel:888-579-9731> or 830-606-3617 <tel:361-289-0725>

Subject: NWS UPDATE: Thunderstorms Sun/Mon - Severe/Heavy Rain Potential

General Overview

Good afternoon,

A strong upper level disturbance will approach North Texas during the day Sunday. Scattered showers and thunderstorms are expected to develop late Sunday afternoon into the evening hours. These showers and storms are expected to congeal into a line and move east overnight into early Monday morning.

Click on the attached PDF for additional graphics and details.

Threats/Hazardous Weather Types

The threats/hazardous weather types are (in order of likelihood):

* Hail/Damaging Winds with initial storm development.
* Frequent cloud to ground lightning
* Locally heavy rainfall causing minor flooding issues.
* Isolated Tornado

Areas of Concern

The primary areas we are concerned about are:

* Severe storm threat is mainly along and west of I-35 from Waco to DFW to Gainesville late Sunday afternoon into the late evening hours.
* Heavy rainfall mainly from midnight into early Monday morning for areas along and east of I-35. Areas from Hearne to Mexia to Athens and southeast of there have the highest forecast rainfall through Monday morning (2-3").

Expected Timing

The timing is:

Forecast Confidence

Our forecast confidence level for this forecast is:

FAQ

Is rain guaranteed? In most areas. Our far western counties will likely see more scattered activity Sunday afternoon/evening.

Is severe weather guaranteed? No. The greatest severe weather threat will be late Sunday afternoon into the late evening for roughly the western half of North Texas.

How big will the hail be? Initial severe thunderstorms could support 1 to 1.5" hail.

Will there be tornadoes? The overall threat is low although initial severe storms could produce a tornado. This threat would be highest to the west and northwest of the Metroplex.

When will the next email update be sent? An update will be sent by midday Sunday with the latest forecast information.

Emergency Manager, Media, and Storm Spotter Information

Bottom Line

Showers and thunderstorms will impact most of North and Central Texas late Sunday into early Monday. Prepare for some severe weather late Sunday afternoon into the late evening. Prepare for some local flooding issues late Sunday night.

Alternate Possibilities

What we are not certain about:

* Coverage of severe weather late Sunday afternoon/evening.

If you have any questions, please contact us through the usual means.

To: undisclosed-recipients:
Subject: Update: Locally Heavy Rainfall & Severe Weather Possible Late this Afternoon into Monday Morning

Good morning South-Central Texas Partners,

Headline:

...Locally Heavy Rainfall likely late this Afternoon through Monday Morning...

...Strong to Briefly Severe Storms possible this Afternoon and Evening...

Reason for Update:

* Have increased rainfall totals farther west to near the U.S. Highway 281 corridor as a conditional risk of higher rainfall amounts could occur near the I-35 corridor late this afternoon and evening.

* 1-2 inches of rainfall is likely with very isolated pockets of 4-5" not outside the realm of possibility. (See Attached Graphics)

* Greatest confidence in overall highest totals will be across the Coastal Plains overnight through Monday Morning.

Timing and Area of Concern:

* Heavy Rainfall: Primarily along and east of U.S Highway 281 in the Coastal Plains late this afternoon through 10am Monday morning.

* Strong to Severe Storms: Hill Country and along and east of U.S. Highway 281 late this afternoon and evening.

Threats & Impacts:

Rainfall: Widespread 1-2 inches along and east of the U.S highway 281 and I-37 corridors. Isolated amounts up to 4 to 5 inches are possible generally east of I-35 into the coastal plains. A small window of localized higher amounts along the I-35 corridor could be possible with very localized pockets of 3-5 inches.

West of U.S. Highway 281, 1 inch or less of rainfall is expected with amounts dropping to near 1/2 inch or less along the Rio Grande. Please reference overview and confidence sections below for uncertainty.

* Some locations could experience minor flooding with flood waters capable of causing small streams, creeks, canals, and ditches to become swollen and overflow in a few places. Flood waters may prompt brief closures of low water crossings. Some river points along the Lower Guadalupe River could experience minor flooding. Other mainstem river basins east of I-35 in South Central Texas could see points in action stage.

Hail: Up to 1 inch in diameter

Winds: Up to 60 mph

Overview:

A strong upper level disturbance is moving across the desert southwest this morning and will shift over the region tonight and Monday morning. Rain chances and scattered thunderstorms chances will increase after 5pm this afternoon. The showers and storms will become more widespread through the early evening from the eastern Hill Country across the I-35 corridor and then transition east of I-35 overnight into Monday morning. The greatest potential for heavy rainfall looks to occur mainly east of U.S. Highway 281 where 1-2 inches of rain with isolated amounts over 4-5 inches will be possible. However, depending on where the first initial round sets up and the amount of heating this afternoon, greater localized totals could be near the I-35 corridor from 5pm through midnight as some models have shifted higher rain amounts farther west. This trend will need to be watched closely. In the worst case scenario, storms could develop and train near the U.S Highway 281 and I-35 corridor areas from 5pm-10pm. Depending on location and amount of rainfall training, a flash flood watch could become a possibility. This is a low conditional risk at this time but not non-zero.

There will also be be a threat some storms could become strong to marginally severe this afternoon and evening. Any of these storms will be capable of producing small hail and damaging straight-line wind gusts.

Confidence:

Moderate on exact placement of heavy rainfall corridor across south central Texas. Confidence is on the increase that heavier rainfall amounts should remain east of the Interstate U.S Highway 281 & 37 corridors. However, please monitor forecasts closely through the afternoon and overnight if higher confidence and radar trends suggest the I-35 corridor could receive more rainfall.

Additional Information Resources:

Here is the latest computer readout from the weather monitors in Fort Worth…. Subject to change with the next computer burp…

jbd/vex

From: Mark Fox - NOAA Federal [mailto:mark.fox@...]
Sent: Thursday, March 23, 2017 20:36
To: undisclosed-recipients:
Subject: NWS UPDATE: Thunderstorms and Fire Weather

Bottom Line

Strong to severe thunderstorms are possible Friday in the east, while critical fire weather conditions will occur in the west. This will be the first of a series of storm systems that will affect the area through the middle of next week.

What has changed? No change for Friday's forecast. Additional information about Sunday and the next system next week.

Overview:

Strong to severe thunderstorms have developed across the high plains and the Texas Panhandle this evening, and these storms will slowly make their way to North and Central Texas well after midnight. As the storms move east, we expect them to increase in both intensity and coverage, forming a long, narrow squall line.

We are also watching two additional systems, one that will move through the area Sunday afternoon, and another system during the middle part of next week. Sunday's system will bring the potential for severe thunderstorms, while the mid week system will bring strong to severe storms, as well as the potential for heavy rainfall.

Areas of Concern

For overnight tonight/Friday: The primary areas we are concerned about can be broken down into two general areas: west and east of I-35/35W

West of I-35/35W : small window of opportunity for thunderstorms, yet the main hazard is expected to be dry conditions and strong non-thunderstorm winds. Critical fire danger will exist for most of this area.

East of I-35/35W: as thunderstorms move east, the potential for severe thunderstorms increases as well.

For Sunday: generally north of Interstate 20.

For Wednesday/Thursday: all of North & Central Texas

Threats/Hazardous Weather Types

Friday:

Note: Lightning is a hazard with 100% of all thunderstorms. Lightning is not explicitly listed here.

Sunday afternoon: There is the potential for severe thunderstorms

Wednesday/Thursday (29th & 30th): Strong thunderstorms and heavy rainfall

Expected Timing

Forecast Confidence

Alternate Possibilities

What we are certain of:

* A north-south band of thunderstorms and rain will evolve somewhere near the I-35 corridor around 6 AM Friday

* There will be enough instability to produce strong thunderstorms, if not severe.

* The storms will be fast moving, reducing the potential for flooding.

What we are not certain about:

* The exact timing of the thunderstorm line. If they formr sooner than expected, and will sweep across the eastern counties sooner than we expect. There's a smaller chance that the entire system will evolve slower than expected, in which case a severe threat would linger in the eastern counties through late afternoon.

* The potential for severe weather. Especially because of the timing of the storms, instability could remain too low to produce severe weather until east of our area of responsibility

FAQ

Is rain guaranteed? No. West of I-35/35W, there will be little (or no) rain.

Is severe weather guaranteed? No

How big will the hail be? Maximum hail size would be golf ball sized or less.

Will there be tornadoes? Can't be ruled out, yet not the primary hazard from the storms.

When will the next email update be sent? This is the last email for the Friday event. Additional emails for Sunday will begin Saturday morning.

If you have any questions, please contact us through the usual means.

6043. FW: Fort Worth NWS UPDATE: Late Friday Afternoon / Overnight Severe Potential

Yahoo group: Temple_ARC
Date: 2017-04-21 17:06:37 UTC
From: Joe Dorn
Topic: 6043 Message: 6043
Attachments: 4 described; binary payloads are missing from this source WARC

I have been pretty well disgusted with the Fort Worth weather forecast for the southern part of their County Warning Area and stopped sending out their advisories. However I have had several people ask about why they are missing so I have decided to resume sending them. Please remember their accuracy for anything south of Hillsborough is very poor except for fast moving systems coming from the northwest..

We are in a transition zone and personal knowledge of the area is necessary to interpret the computer generated forecasts and that knowledge has retired from the FTW NWS.

FWIW: I have well over a hundred people on my BCC weather lists

Joe B. Dorn, W5VEX

7969 West FM 93

Belton, Texas 76513

To: undisclosed-recipients:
Subject: NWS UPDATE: Late Afternoon / Overnight Severe Potential

<https://lh4.googleusercontent.com/vReS0Ow-j3jmRsfGyUGQIqa-VCISVJh_dVwCGpPLzwrDT5PYBvHDfZIeyfmRJ74GXEWXtugxNZ2z_hlPPSvYA2YqkG3Ac0Ld6SCCUThd67GW-1f2YeN6EZTgVlKyGvtPwuGpEg5r>

Bottom Line

Strong to severe thunderstorms are possible late this afternoon and tonight. Some storms will be severe, before the system moves south and east through the overnight hours.

Overview

A cluster of thunderstorms remains in Oklahoma this morning, where a severe thunderstorm watch is in effect until Noon. Later today, the cold front and outflow boundaries will be moving southward, and will provide a focus for thunderstorms to develop late this afternoon and early evening. There will be the potential for strong to severe thunderstorms as the system moves through the region tonight and overnight.

Areas of Concern

The primary areas we are concerned about are:

Most areas will at least see a chance for rain and a few thunderstorms. The greatest potential for severe thunderstorms will be roughly along and north of Interstate 20, or in the red areas below (broken out with timing)

Threats/Hazardous Weather Types

Note: Lightning is a hazard with 100% of all thunderstorms. Lightning is not explicitly listed here.

Expected Timing

Forecast Confidence

Alternate Possibilities

What we are certain of:

* Plenty of moisture, instability, and lift for thunderstorms.

* Timing: Fast moving system will affect the area today/tonight and leave the area around sunrise Saturday

* Timing: Severe threat for any one spot will last a few hours, and then move away.

* Capping inversion will keep storms from forming until the front moves in.

What we are less certain of:

* Tornado threat. If discrete cells are able to form ahead of the line, the tornado risk will be higher.

* Boundary locations. The exact location of the cold front and outflow boundaries will determine severity in some spots

FAQ

Is rain guaranteed? No. Many areas will see rain. Some will not see any rain.

Is severe weather guaranteed? No. Not everyone will see severe weather.

How big will the hail be? Hail larger than 2" in diameter is possible in the worst storms.

Will there be tornadoes? Tornadoes are possible, yet are not the primary threat.

Will weekend plans be affected? Only the ones tonight. Saturday and Sunday will be nice, but it will be breezy and cool on Saturday.

When will the next email update be sent? This is the last email for this event.

If you have any questions, please feel free to contact us through the usual means

Cell: (254) 721-0829 (Not usually on)

From: Mark Fox - NOAA Federal [mailto:mark.fox@...]
Sent: Thursday, April 27, 2017 10:27
To: undisclosed-recipients:
Subject: NWS UPDATE: Weekend Thunderstorms

<https://lh4.googleusercontent.com/vReS0Ow-j3jmRsfGyUGQIqa-VCISVJh_dVwCGpPLzwrDT5PYBvHDfZIeyfmRJ74GXEWXtugxNZ2z_hlPPSvYA2YqkG3Ac0Ld6SCCUThd67GW-1f2YeN6EZTgVlKyGvtPwuGpEg5r>

Bottom Line

Thunderstorms, some severe, will affect the area this weekend: late Friday afternoon and Saturday. While thunderstorms will not be continuous during this time, thunderstorms will likely affect outdoor events and will have the potential for all types of severe weather.

Overview

A large upper level storm, currently located in western Canada, will strengthen and move into the Rocky Mountain states later today and Friday. By early Saturday morning, this upper level storm will move into West Texas, setting the stage for multiple rounds of strong-severe thunderstorms. On Friday, any storms are expected to be scattered in nature, and most activity will not begin until late afternoon or early evening. As the upper level storm and cold front move closer to Texas, the rain and thunderstorms will pick up in strength and coverage on Saturday. The upper level system will be the primary factor for the end of the event, and this system is expected to move out of the area late Saturday night, leaving Sunday to be cloudy and cool and windy, but rain free.

Areas of Concern

The primary areas we are concerned about are:

Threats/Hazardous Weather Types

Note: Lightning is a hazard with 100% of all thunderstorms. Lightning is not explicitly listed here.

Expected Timing

Forecast Confidence

Alternate Possibilities

What we are certain of:

* Strength of the upper level storm system is more than sufficient to produce widespread thunderstorms.

* Multiple rounds of storms, yet rain will not be continuous. Several breaks in the rain/thunderstorms expected.

* Timing: Most of Friday will be ok, with storms (if any) will occur late in the day / evening hours.

What we are less certain of:

* Heavy rainfall potential: this system will be a prolific rain maker for parts of the south plains states. Whether or not we receive flooding is not yet certain.

* Timing: exact timing and locations of the individual rounds of thunderstorms is not yet certain.

* Exact location of the upper level and surface features will determine heaviest rainfall amounts, and/or strong to severe thunderstorms.

FAQ

Is rain guaranteed? No. Some areas will not see rain, but most of us will.

Is severe weather guaranteed? No

How big will the hail be? Golf ball to baseball sized hail will be possible in the strongest storms.

Will there be tornadoes? This system will produce supercell thunderstorms. Tornadoes are possible.

When will the timing become more certain? Tough to answer. The timeline above is our best thinking right now. Most likely, this will be storm system that will require careful monitoring all day Saturday.

When will the next email update be sent? Friday morning, between 10-11 AM

If you have any questions, please feel free to contact us through the usual means

Subject: Strong to Severe Storms Possible Saturday Night

Good afternoon South-Central Texas Partners,

Headline:

...Strong to Severe Storms Possible Saturday Night...

Area of Concern:

Hill Country and along and east of the I-35 corridor.

Threats & Impacts:

Winds: Damaging straight-line winds in excess of 60 mph possible.

Hail: Hail 1-2" in diameter possible.

Rainfall: 1/4 to 1 inch with pockets up to 2 inches

Timing and Overview:

An upper level system and associated surface cold front will bring a chance of storms to portions of South Central Texas Saturday night. A few isolated storms could be possible near and east of I-35 as early as Saturday afternoon. However the best chance of storms will come between 7 PM and 11 PM across the Hill Country and I-35 corridor and 10 PM to 2 AM east of I-35. Some storms will be capable of producing hail and damaging straight-line winds. The Storm Prediction Center has placed portions of the area in a Slight to Enhanced risk for severe storms (see attached graphic).

In addition, frequent cloud to ground lightning will be possible. Due to the progressive nature of this storm system the threat for widespread heavy rainfall is minimal.

Confidence:

Moderate

Bottom Line

Severe weather and locally heavy rain is still on tap for later today, mainly along and east of I-35/35W. Large hail and damaging winds will be the main threats.

Overview

A strong cold front tied to a powerful upper level trough to the west will move into the region today. Thunderstorms are expected to initiate along the cold front by early afternoon somewhere in the vicinity of the I-35 corridor and will continue to move east through the evening hours. These initial storms along the front will have the potential to produce very large hail and damaging winds. The tornado threat will be lower with this system as the main area of thunderstorms will be along a cold front. If any storms can develop ahead of the front, then those storms would have a slightly higher tornado potential. Hail and damaging winds will remain the main hazards with this event. Additional thunderstorms may develop late tonight and overnight well behind the cold front as the core of the upper trough moves over. Hail and lightning would be the main threats.

Areas of Concern

The primary areas we are concerned about are:

Initial Development: Right along the cold front which should extend from near Sherman to Fort Worth to Goldthwaite around 1 PM.

Through the late Evening: Areas along and east of I-35/35W.

Threats/Hazardous Weather Types

Expected Timing

Forecast Confidence

Alternate Possibilities

What we are certain of:

* Severe weather is likely today along the cold front.
* Large hail and damaging winds are the main threats.
* The main area for severe weather will be along and east of I-35.

What we are less certain of:

* The location of the cold front when storms initiate. This could vary by 20-40 miles or so through early afternoon.
* The tornado threat. Right now the tornado threat appears generally low. If any storms develop ahead of the front then these would have a higher tornado potential.
* Rainfall amount and flash flooding potential. Storms should be moving fairly quickly, although training storms could produce locally heavy rainfall. This threat is highest across our northeast counties.

FAQ

Is rain guaranteed? No. Many areas west of I-35 will not see rainfall.

Is severe weather guaranteed? Severe weather is expected. This threat will be highest along and east of I-35.

How big will the hail be? Golf-ball sized or larger can be expected with the strongest storms.

Will there be tornadoes? A few tornadoes can not be ruled out. This threat will be higher with storms ahead of the front.

When will the next email update be sent? This will be the last email for this event.

Subject: Strong to Severe Storms Possible Saturday Night

Good afternoon South-Central Texas Partners,

Headline:

...Strong to Severe Storms Possible Saturday Night...

Area of Concern:

Portions of the Hill Country and along and east of the I-35 corridor.

Threats & Impacts:

Winds: Damaging straight-line winds in excess of 60 mph possible.

Hail: Hail 1-2" in diameter possible.

Rainfall: 1/4 to 1 inch with isolated pockets up to 2 inches.

Timing and Overview:

Overall, there have been very little changes to the forecast. We still expect a chance of strong to severe thunderstorms this evening into early Sunday morning as an upper level system and cold front move across South Central Texas. The best chance of storms will come between 7 PM and Midnight Saturday evening across eastern portions of the Hill Country and I-35 corridor and 10 PM to 2 AM east of I-35. Some storms will be capable of producing large hail and damaging straight-line winds. The Storm Prediction Center continues to place portions of the area in a Slight to Enhanced risk for severe storms for mainly Saturday

night (see attached graphic).

In addition, frequent cloud to ground lightning will be possible. Due to the progressive nature of this storm system the threat for widespread heavy rainfall and flooding is minimal. Rainfall amounts will average 1/4 to 1 inch. A few pockets of 1-2 inches of rainfall will be possible east of I-35 and north of I-10. Much lesser amounts of rainfall will occur farther west, with little to no rain expected along the Rio Grande.

Some showers and possibly a few non-severe storms could linger into Sunday morning. However, the chance for severe weather should decrease significantly after the main line of storms moves through the region.

Confidence:

Moderate
